Chronological Charts

They are explained and discussed on p. 350. The abbreviations on the charts are as follows:

Chart I

FM = Fine Monochrome, of the thin-walled black or buff variety (2, 4, 10 etc).
EP = Early Painted
LP = Late Painted
SS = Smeary slip, and, generally, the different kinds of proto-firnis.
WW = White Ware
PC = Proto Carinations, angular shoulders.
CJ = Collar Jars
Urf = Urfirnis: Urfirnis proper, not the intermediate low-lustre slips.
S-F = Stroke-Firnis
BL = Black Monochrome of the Period III kind
MP = Matt Painted ware

Chart II

MPa = Normal matt dark paint on buff or cream
MPb = Red, or glossy dark paint
Gr = Fine Grey ware
LP = Late Polychrome of the Klenia-Prosymna varieties

Chart III

Pros. Inc. = Prosymnna Incised ware
Gr = Crusted ware
SB = Stroke Burnished
PB = Red Pattern Burnished ware of the Prosymnna and Aigina kinds
Ago-Kef = Types and traits of the Agora-Kefala culture
Pelos-Alep = All the types and traits associated with the rolled-rim bowls from sites on the islands, in Attica and the Peloponnese.
The carbon-14 series on Chart III are based on the following published dates (B.C.) -

1. Franchthi (Jacobsen 1973a, table 8; Radiocarbon 13, 1971, 364f; 14, 1974, 214)
   - P 1660 3311 +/- 64 FN
   - P 1659 3213 +/- 78 FN

2. Halieis (Radiocarbon 13, 1971, 367)
   - P 1397 3152 +/- 72 Bedrock deposit of shell with Kefala.

3. Kefala (Caskey 1968, 314; Radiocarbon 11, 1969, 156)
   - P 1280 2876 +/- 56 Kefala Culture.
   - ? 3031 +/- 58

4. & 5. Sitagroi (Renfrew 1970, 302)
   - Bln 773 2440 +/- 100 Sitagroi IV, E.B. I.
   - Bln 782 2360 +/- 100
   - Bln 781 2135 +/- 150 Sitagroi V, E.B. II.
   - Bln 780 1920 +/- 100

5. & 6. Eutresis (Kohler and Ralph 1961, 357f)
   - P 306 2496 +/- 69 Group IV, EH I.
   - P 307 2492 +/- 57 Group III, EH I.
   - P 317 2262 +/- 56 Group VIII, EH II.

6. Lerna (Kohler and Ralph 1961, 365)
   - P 318 2120 +/- 65 House of Tiles, EH II.
   - P 319 2027 +/- 59

The lateness of the Lerna dates could be due to a number of methodological factors, but it is also worth remarking that the earliest EH II material from the site belongs to a typologically developed stage and therefore does not represent the beginning of EH II.

The carbon-14 series on Chart IV are based on the following published dates (B.C.); those marked with an asterisk were not used on the chart because the degree of discrepancy makes their reliability doubtful:

Franchthi (Jacobsen 1969, 374-5; 1973a, table 8; Radiocarbon 13, 364f; 14, 214 f)
   - P 1526 6072 +/- 76 Meso - Neo transition.
   - P 1527 5947 +/- 88

The list is not exhaustive. Other dates, which were not known to me at the time Chart IV was drawn, include two from Argissa, of which the first is clearly erroneous and the second is in general agreement with those from Sesklo and Kitsos:

Recently published dates from Achilleion add welcome confirmation to the EN and MN series in Thessaly (Radiocarbon 17, 1975, 200-201). New dates for the Franchthi Early Neolithic confirm the earliness of the first neolithic in the Peloponnese and suggest that perhaps Q 655 from Nea Nikomedea is not as improbable as has been thought. One of them (P 2093) appears to be rather late, but its cultural context is not given in detail and it may be in order.

Catalogue of Illustrations

Most of the abbreviations used in the descriptions of the drawings and photographs will be obvious, but a short key is given below to avoid possible ambiguities. Where known, the deposit, stratum and inventory numbers follow the name of the site. Figures in brackets refer to other illustrations of the same sherd or vessel, and the description is only given once. "LWK" refers to an assortment of old Walker-Kosmopoulos material without labels which Dr. Williams kindly allowed me to rummage through, and which produced some fine specimens of certain wares and types. "1937" refers to the material from Weinberg's excavations on Temple Hill, and "1959" to the large collection from his excavations of that year in the Forum West and Lechaion Road areas, of which I only examined a small fraction. "KDV" after a Lerna profile means that it was taken from a drawing by Dr. Vitelli, to whom thanks are warmly tendered. I am deeply indebted to Professor Caskey for allowing me to study and draw representative material from his excavations, and to Professor Weinberg for allowing me to use the results of his Corinth excavations. Dr. Croissant most amiably put the neolithic material from the French School excavations at Argos at my disposal.

A discussion of the illustrated pieces, and sometimes a more detailed description, will be found in the appropriate section of the Catalogue of Shapes which deals with the particular ware, shape, feature or decoration.

2. Alepotrypa (Hauptmann 1971, fig. 52a); fn grained marble; broken at neck; h. .087m; sim torso from Athens Acropolis (Hesperia 8, 1939, 406; fig. 88).
3. Alepotrypa; = 61,18.
4. Asea fig 111,1; hd med fh bl, wh grts; thn dull rd skins; well b warm tan; broken neck & waist; arms bent at elbow; shoulder width .070m (1:1).

Fig. 103
Alepotrypa Metal.
1. Sparta Museum 5610. L. .148; W. butt .006, centre .011, blade .009; max Th. .0105m. Top, bottom and sides flat, corners square. Rounded butt slightly jagged, and swollen from percussion or haft-squeeze. Blade with ground bevel, rounded and slightly battered. The whole tool is curved downwards and sideways, probably
from use. A patch of pale green corrosion on one
side (v. photo) bears faint impressions as from a
bone or antler sleeve. The cut on the top is modern.

2. 5611. L. .078; W. butt .018, blade 1037; max Th. .011m.
Convex top, flat bottom and sides; corners square.
The butt has rough-cast pitting and a casting
depression, and shows no signs of percussion or
squeeze. The blade is sharp, but burred at the
corners.

3. 5612. L. .061; W. butt .017, blade .010; max Th. .009m. Top
slightly convex, bottom slightly hollow near the
blade, sides flat; corners square. Butt slightly
oblique, with porous granular surface and burred
edges; probably broken and reused. Blade sharp,
straight and slightly battered.

4. d. .040; av. Th. .003; expanded end d. .005m. Another similar,
broken, with small casting protuberance, still
rough, near break.

5. d. .055; av. Th. .004; expanded ends d. .007m. Surface shows
gold coloured streaks at one place, and there are
shakes on one side as from cold bending or hammering.
Another similar, restored.

6. Small beads d. ca .003m, apparently cut as segments from a
continuous, seamless tube with max wall Th. .00025.
Central bead d. ca .0065, W. .003m (photo slightly
larger than 1:1).

7. Oval bead: L. .011; max d. .0075; end d. .005m. Made from
thin sheet silver. Pendant: max L. .024; max
Th. .0025. One face slightly convex; the other,
flat. The holes have been drilled and reamed
(ca 2:1).

The set of silver jewellery is illustrated in Hauptmann 1971, fig. 53.
The metal from Alepotrypa has been briefly discussed above (p. 52). The copper tools, along with the two Sesklo axes, were, with the permission of Professor Marinatos, drilled in 1970 by Professor Henrickson for a trace element analysis by neutron activation at the Democritos establishment, and it is hoped to treat them more fully in a short article. The jewellery and tools, with other more recent metal finds by Papathanasopoulos (AD 17, 1961-2, pl. 67; Lambert 1972, 860) make Alepotrypa the richest site in Greece for metal artifacts of this period. It has been suggested above that this period is not later than the transition from Final Neolithic to EH I, and contemporary with the earliest Grotta-Pelos phase. This is my conclusion from a study of the pottery which was available before 1971, when Papathanasopoulos made the first archaeological excavations in the cave. The typological evidence of the metal artifacts themselves cannot be strong because so little pre-EH II metalwork is known in the Aegean. The adze is unique in this region; there is one almost identical from the Grotta Tominz at San Canziano, near Trieste, not well dated and geographically remote. Copper tools from Neolithic contexts in Albania, including a "hache-burin" indicate that metal was in use at this time along the southern Adriatic coast (Bull. d'Arch. S.-E. Eur. 2, 1972, 13), and axes typologically close to late stone celts are known from a few neolithic sites in Greece and Crete (Pevkakia, perhaps Sesklo, Knossos); one in the BSA "from Spata" is an exact replica of a common type of celt. The chisels have parallels in EB I Aegean contexts (Troy I; Poliochni) as well as later ones. The pendant has close parallels, in other materials and in metal, at Eileithya, Kitsos, Pevkakia and Sesklo. Further afield it is a common type in the East Aegean, the Balkans and Central Europe, and is found as far north as West Gotland, at different periods.
