Supplemental data: Relationship between virus decline in blood (A. and B.) and urine (C. and D.) and ganciclovir levels over the first 7 days of antiviral treatment for congenital cytomegalovirus infection. Data are shown for day 7 pre- (trough: B. and D.) and post- (peak: A. and C.) ganciclovir levels taken on day 7 of treatment in 5 babies. Treatment was with ganciclovir in 4 and valganciclovir in 1 baby.
