S.1 Proof of Identification (Theorem 2.1)

Proof of Theorem 2.1. Let \( Q(\beta, \lambda, f) \equiv \mathbb{E}\left( \| Y - \beta \cdot X - \lambda f' \|^2_F \bigg| \lambda^0, f^0, w \right) \), where \( \beta \in \mathbb{R}^K \), \( \lambda \in \mathbb{R}^{N \times R} \) and \( f \in \mathbb{R}^{T \times R} \). We have

\[
Q(\beta, \lambda, f) = \mathbb{E}\left\{ \text{Tr} \left[ (Y - \beta \cdot X - \lambda f') (Y - \beta \cdot X - \lambda f') \right] \bigg| \lambda^0, f^0, w \right\} \\
= \mathbb{E}\left\{ \text{Tr} \left[ (\lambda^0 f'^0 - \lambda f' - (\beta - \beta^0) \cdot X + e)' (\lambda^0 f'^0 - \lambda f' - (\beta - \beta^0) \cdot X + e) \right] \bigg| \lambda^0, f^0, w \right\} \\
= \mathbb{E}\left\{ \text{Tr} \left[ (e'e) \bigg| \lambda^0, f^0, w \right] \\
+ \mathbb{E}\left\{ \text{Tr} \left[ (\lambda^0 f'^0 - \lambda f' - (\beta - \beta^0) \cdot X)' (\lambda^0 f'^0 - \lambda f' - (\beta - \beta^0) \cdot X) \bigg| \lambda^0, f^0, w \right] \right\} \\
\equiv Q^*(\beta, \lambda, f) \right. 
\]

In the last step we used Assumption ID\((ii)\). Because \( \mathbb{E}\left[ \text{Tr} \left( e'e \right) \bigg| \lambda^0, f^0, w \right] \) is independent of \( \beta, \lambda, f \), we find minimizing \( Q(\beta, \lambda, f) \) is equivalent to minimizing \( Q^*(\beta, \lambda, f) \). We decompose

\( ^1 \)Department of Economics and USC Dornsife INET, University of Southern California, Los Angeles, CA 90089-0253. Email: moonr@usc.edu. Department of Economics, Yonsei University, Seoul, Korea.

$Q^* (\beta, \lambda, f)$ as follows

\[
Q^* (\beta, \lambda, f) = \mathbb{E} \left\{ \text{Tr} \left[ \lambda^0 f^0 - \lambda f' - (\beta - \beta^0) \cdot X \right] \right\} \left| \lambda^0, f^0, w \right\
\]

\[
= \mathbb{E} \left\{ \text{Tr} \left[ (\lambda^0 f^0 - \lambda f') \cdot M_{\lambda, \lambda^0, w} (\lambda^0 f^0 - \lambda f' - (\beta - \beta^0) \cdot X) \right] \right\} \left| \lambda^0, f^0, w \right\
\]

\[
+ \mathbb{E} \left\{ \text{Tr} \left[ (\lambda^0 f^0 - \lambda f' - (\beta - \beta^0) \cdot X) \cdot P_{\lambda, \lambda^0, w} (\lambda^0 f^0 - \lambda f' - (\beta - \beta^0) \cdot X) \right] \right\} \left| \lambda^0, f^0, w \right\
\]

\[
\equiv Q_{\text{high}} (\beta, \lambda, \lambda^0, f)
\]

where $(\beta_{\text{high}} - \beta^0_{\text{high}}) \cdot X_{\text{high}} = \sum_{m=k+1}^K (\beta_m - \beta^0_m) X_m$. A lower bound on $Q_{\text{high}} (\beta_{\text{high}}, \lambda)$ is given by

\[
Q_{\text{high}} (\beta_{\text{high}}, \lambda) \geq \min_{\tilde{\lambda} \in \mathbb{R}^N \times (R + R + \text{rank}(w))} \mathbb{E} \left\{ \text{Tr} \left[ (\beta_{\text{high}} - \beta^0_{\text{high}}) \cdot X_{\text{high}} \right] \right\} \leq Q_{\text{high}} (\beta_{\text{high}}), \lambda
\]

\[
\geq \min_{\bar{r} \in R + R + \text{rank}(w)} \sum_{r=R+R+\text{rank}(w)} \mathbb{E} \left\{ \left( (\beta_{\text{high}} - \beta^0_{\text{high}}) \cdot X_{\text{high}} \right) \right\} \left( (\beta_{\text{high}} - \beta^0_{\text{high}}) \cdot X_{\text{high}} \right) \left| \lambda^0, f^0, w \right|.
\]

(S.1.1)

Because $Q^* (\beta, \lambda, f)$, $Q_{\text{high}} (\beta_{\text{high}}, \lambda)$, and $Q_{\text{low}} (\beta, \lambda, f)$, are expectations of traces of positive semi-definite matrices we have $Q^* (\beta, \lambda, f) \geq 0$, $Q_{\text{high}} (\beta_{\text{high}}, \lambda) \geq 0$, and $Q_{\text{low}} (\beta, \lambda, f) \geq 0$ for all $\beta$, $\lambda$, $f$. Let $\bar{\beta}$, $\bar{\lambda}$ and $\bar{f}$ be the parameter values that minimize $Q(\beta, \lambda, f)$, and thus also $Q^* (\beta, \lambda, f)$. Because $Q^* (\beta^0, \lambda^0, f^0) = 0$ we have $Q^* (\bar{\beta}, \bar{\lambda}, \bar{f}) = \min_{\beta, \lambda, f} Q^* (\beta, \lambda, f) = 0$. This implies $Q_{\text{high}} (\beta_{\text{high}}, \bar{\lambda}) = 0$ and $Q_{\text{low}} (\bar{\beta}, \bar{\lambda}, \bar{f}) = 0$. Assumption ID$(v)$, the lower bound (S.1.1), and $Q_{\text{high}} (\bar{\beta}_{\text{high}}, \bar{\lambda}) = 0$ imply $\beta_{\text{high}} = \beta^0_{\text{high}}$. Using this, we find

\[
Q_{\text{low}} (\bar{\beta}, \bar{\lambda}, \bar{f}) = \mathbb{E} \left\{ \text{Tr} \left[ (\lambda^0 f^0 - \bar{\lambda} f' - (\bar{\beta} - \beta^0_{\text{low}}) \cdot X_{\text{low}}) \right] \right\} \left| \lambda^0, f^0, w \right|.
\]

\[
\geq \min_{\bar{f}} \mathbb{E} \left\{ \text{Tr} \left[ (\lambda^0 f^0 - \bar{\lambda} f' - (\bar{\beta} - \beta^0_{\text{low}}) \cdot X_{\text{low}}) \right] \right\} \left| \lambda^0, f^0, w \right|.
\]

\[
= \mathbb{E} \left\{ \text{Tr} \left[ (\lambda^0 f^0 - (\bar{\beta} - \beta^0_{\text{low}}) \cdot X_{\text{low}}) \right] \right\} \left| \lambda^0, f^0, w \right|.
\]

(S.1.2)
where \((\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}} = \sum_{i=1}^{K} (\beta_i - \beta^0_i) X_i\). Because \(Q^{\text{low}}(\beta, \lambda, f) = 0\) and the last expression in (S.1.2) is non-negative we must have

\[
\mathbb{E}\left\{ \text{Tr} \left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) \right] \right\} = 0.
\]

Using \(M_\lambda = M_\lambda M_\lambda\) and the cyclicity of the trace we obtain from the last equality:

\[
\text{Tr}\left\{ M_\lambda A M_\lambda \right\} = 0,
\]

where \(A = \mathbb{E}\left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] \). The trace of a positive semi-definite matrix is only equal to zero if the matrix itself is equal to zero, so we find

\[
M_\lambda A M_\lambda = 0,
\]

This together with the fact that \(A\) itself is positive semi definite implies (note that \(A\) positive semi-definite implies \(A = CC'\) for some matrix \(C\), and \(M_\lambda A M_\lambda = 0\) then implies \(M_\lambda C = 0\), i.e., \(C = P_\lambda C\))

\[
A = P_\lambda A P_\lambda,
\]

and therefore \(\text{rank}(A) \leq \text{rank}(P_\lambda) \leq R\). We have thus shown

\[
\text{rank}\left\{ \mathbb{E}\left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] \lambda^0, f^0, w \} \right\} \leq R.
\]

We furthermore find

\[
R \geq \text{rank}\left\{ \mathbb{E}\left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] \lambda^0, f^0, w \} \right\}
\]

\[
\geq \text{rank}\left\{ M_w \mathbb{E}\left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] M_w \lambda^0, f^0, w \} \right\}
\]

\[
+ \text{rank}\left\{ P_u \mathbb{E}\left[ (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\lambda^0 f^0 - (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] P_u \lambda^0, f^0, w \} \right\}
\]

\[
\geq \text{rank} \left\{ M_w \lambda^0 f^0 f^0 \lambda^0 M_w \right\}
\]

\[
+ \text{rank}\left\{ \mathbb{E}\left[ (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] \lambda^0, f^0, w \} \right\}.
\]

Assumption ID(iv) guarantees \(\text{rank} \left( M_w \lambda^0 f^0 f^0 \lambda^0 M_w \right) = \text{rank} \left( \lambda^0 f^0 f^0 \lambda^0 \right) = R\), that is, we must have

\[
\mathbb{E}\left[ (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}}) (\beta^{\text{low}} - \beta^{0,\text{low}}) \cdot X_{\text{low}})' \right] \lambda^0, f^0, w \] = 0.
\]

According to Assumption ID(iii) this implies \(\beta^{\text{low}} = \beta^{0,\text{low}}\), i.e., we have \(\beta = \beta^0\). This also implies \(Q^*(\beta, \lambda, f) = \|\lambda^0 f^0 - \lambda \tilde{f}^0\|_F^2 = 0\), and therefore \(\lambda \tilde{f}^0 = \lambda^0 f^0\).
S.2 Examples of Error Distributions

The following Lemma provides examples of error distributions that satisfy $\|e\| = O_p(\sqrt{\max(N,T)})$ as $N,T \to \infty$. Example (i) is particularly relevant for us, because those assumptions on $e_{it}$ are imposed in Assumption 5 in the main text, i.e., under those main text assumptions we indeed have $\|e\| = O_p(\sqrt{\max(N,T)})$.

Lemma S.2.1. For each of the following distributional assumptions on the errors $e_{it}$, $i = 1,\ldots,N$, $t = 1,\ldots,T$, we have $\|e\| = O_p(\sqrt{\max(N,T)})$.

(i) The $e_{it}$ are independent across $i$ and $t$, conditional on $C$, and satisfy $\mathbb{E}(e_{it}|C) = 0$, and $\mathbb{E}(e_{it}^4|C)$ is bounded uniformly by a non-random constant, uniformly over $i,t$ and $N,T$. Here $C$ can be any conditioning sigma-field, including the empty one (corresponding to unconditional expectations).

(ii) The $e_{it}$ follow different MA($\infty$) processes for each $i$, namely

$$e_{it} = \sum_{\tau=0}^{\infty} \psi_{it} u_{i,t-\tau}, \quad \text{for } i = 1\ldots N, \ t = 1\ldots T, \quad (S.2.1)$$

where the $u_{it}$, $i = 1\ldots N$, $t = -\infty\ldots T$ are independent random variables with $\mathbb{E}u_{it} = 0$ and $\mathbb{E}u_{it}^4$ uniformly bounded across $i,t$ and $N,T$. The coefficients $\psi_{it}$ satisfy

$$\sum_{\tau=0}^{\infty} \max_{i=1\ldots N} \psi_{it}^2 < B, \quad \sum_{\tau=0}^{\infty} \max_{i=1\ldots N} |\psi_{it}| < B, \quad (S.2.2)$$

for a finite constant $B$ which is independent of $N$ and $T$.

(iii) The error matrix $e$ is generated as $e = \sigma^{1/2} u \Sigma^{1/2}$, where $u$ is an $N \times T$ matrix with independently distributed entries $u_{it}$ and $\mathbb{E}u_{it} = 0$, $\mathbb{E}u_{it}^2 = 1$, and $\mathbb{E}u_{it}^4$ is bounded uniformly across $i,t$ and $N,T$. Here $\sigma$ is the $N \times N$ cross-sectional covariance matrix, and $\Sigma$ is the $T \times T$ time-serial covariance matrix, and they satisfy

$$\max_{j=1\ldots N} \sum_{i=1}^{N} |\sigma_{ij}| < B, \quad \max_{t=1\ldots T} \sum_{\tau=1\ldots T} |\Sigma_{\tau t}| < B, \quad (S.2.3)$$

for some finite constant $B$ which is independent of $N$ and $T$. In this example we have $\mathbb{E}e_{it}e_{j\tau} = \sigma_{ij} \Sigma_{\tau t}$.
Proof of Lemma S.2.1, Example (i). Latala (2005) showed that for a $N \times T$ matrix $e$ with independent entries, conditional on $C$, we have

$$\mathbb{E}(\|e\| | C) \leq c \left\{ \max_i \left[ \sum_t \mathbb{E}(e_{it}^2 | C) \right]^{1/2} + \max_j \left[ \sum_i \mathbb{E}(e_{it}^2 | C) \right]^{1/2} + \left[ \sum_{i,t} \mathbb{E}(e_{it}^4 | C) \right]^{1/4} \right\},$$

where $c$ is some universal constant. Because we assumed uniformly bounded 4th conditional moments for $e_{it}$ we thus have $\|e\| = O_P(\sqrt{T}) + O_P(\sqrt{N}) + O_P((TN)^{1/4}) = O_p(\sqrt{\max(N,T)})$.

Example (ii). Let $\psi_j = (\psi_{ij}, \ldots, \psi_{Nj})$ be an $N \times 1$ vector for each $j \geq 0$. Let $U_{-j}$ be an $N \times T$ sub-matrix of $(u_{it})$ consisting of $u_{it}, i = 1 \ldots N, t = 1 - j, \ldots, T - j$. We can then write equation (S.2.1) in matrix notation as

$$e = \sum_{j=0}^{\infty} \text{diag}(\psi_j) U_{-j} = \sum_{j=0}^{T} \text{diag}(\psi_j) U_{-j} + r_{NT},$$

where we cut the sum at $T$, which results in the remainder $r_{NT} = \sum_{j=T+1}^{\infty} \text{diag}(\psi_j) U_{-j}$. When approximating an MA($\infty$) by a finite MA($T$) process we have for the remainder

$$\mathbb{E}(\|r_{NT}\|_F^2) = \sum_{i=1}^{N} \sum_{t=1}^{T} \mathbb{E}(r_{NT})_{ij}^2 \leq \sigma_u^2 \sum_{i=1}^{N} \sum_{t=1}^{T} \sum_{j=T+1}^{\infty} \psi_{ij}^2 \leq \sigma_u^2 N T \sum_{j=T+1}^{\infty} \max_i (\psi_{ij}) \leq \sigma_u^2 N \sum_{j=T+1}^{\infty} j \max_i (\psi_{ij}),$$

where $\sigma_u^2$ is the variance of $u_{it}$. Therefore, for $T \to \infty$ we have

$$\mathbb{E}\left(\left(\frac{\|r_{NT}\|_F^2}{N}\right)\right) \rightarrow 0,$$

which implies $(\|r_{NT}\|_F^2) = O_p(N)$, and therefore $\|r_{NT}\| \leq \|r_{NT}\|_F = O_p(\sqrt{N})$.

Let $V$ be the $N \times 2T$ matrix consisting of $u_{it}, i = 1 \ldots N, t = 1 - T, \ldots, T$. For $j = 0 \ldots T$ the matrices $U_{-j}$ are sub-matrices of $V$, and therefore $\|U_{-j}\| \leq \|V\|$. From example (i) we know $\|V\| = O_p(\sqrt{\max(N,2T)})$. Furthermore, we know $\| \text{diag}(\psi_j) \| \leq \max_i (|\psi_{ij}|).$
Combining these results we find
\[
\|e\| \leq \sum_{j=0}^{T} \| \text{diag}(\psi_j) \| \|U_{-j}\| + \|r_{NT}\| \\
\leq \sum_{j=0}^{T} \max_i (|\psi_{ij}|) \|V\| + o_p(\sqrt{N}) \\
\leq \left[ \sum_{j=0}^{\infty} \max_i (|\psi_{ij}|) \right] \mathcal{O}_p(\sqrt{\max(N,2T)}) + o_p(\sqrt{N}) \\
\leq \mathcal{O}_p(\sqrt{\max(N,T)}),
\]
as required for the proof.

**Example (iii).** Because \(\sigma\) and \(\Sigma\) are positive definite, there exits a symmetric \(N \times N\) matrix \(\phi\) and a symmetric \(T \times T\) matrix \(\psi\) such that \(\sigma = \phi^2\) and \(\Sigma = \psi^2\). The error term can then be generated as \(e = \phi u \psi\), where \(u\) is an \(N \times T\) matrix with iid entries \(u_{it}\) such that \(\mathbb{E}(u_{it}) = 0\) and \(\mathbb{E}(u_{it}^4) < \infty\). Given this definition of \(e\) we immediately have \(\mathbb{E}e_{it} = 0\) and \(\mathbb{E}e_{it}e_{jt} = \sigma_{ij}\Sigma_{t\tau}\). What is left to show is \(\|e\| = \mathcal{O}_p(\sqrt{\max(N,T)})\). From example (i) we know \(\|u\| = \mathcal{O}_p(\sqrt{\max(N,T)})\).

Using the inequality \(\|\sigma\| \leq \sqrt{\|\sigma\|_1 \|\sigma\|_\infty} = \|\sigma\|_1\), where \(\|\sigma\|_1 = \|\sigma\|_\infty\) because \(\sigma\) is symmetric we find
\[
\|\sigma\| \leq \|\sigma\|_1 \equiv \max_{j=1\ldots N} \sum_{i=1}^{N} |\sigma_{ij}| < L,
\]
and analogously \(\|\Sigma\| < L\). Because \(\|\sigma\| = \|\phi\|^2\) and \(\|\Sigma\| = \|\psi\|^2\), we thus find \(\|e\| \leq \|\phi\|\|u\|\|\psi\| \leq L\mathcal{O}_p(\sqrt{\max(N,T)}),\) i.e., \(\|e\| = \mathcal{O}_p(\sqrt{\max(N,T)})\).

**S.3 Comments on Assumption 4 on the regressors**

Consistency of the LS estimator \(\hat{\beta}\) requires the regressors not only satisfy the standard non-collinearity condition in assumption 4(i), but also the additional conditions on high- and low-rank regressors in assumption 4(ii). Bai (2009) considers the special cases of only high-rank and only low-rank regressors. As low-rank regressors he considers only cross-sectional invariant and time-invariant regressors, and he shows that if only these two types of regressors are present, one can show consistency under the assumption \(\text{plim}_{N,T \to \infty} W_{NT} > 0\) on the regressors (instead of assumption 4), where \(W_{NT}\) is the \(K \times K\) matrix defined by \(W_{NT,k_1k_2} = (NT)^{-1} \text{Tr}(M_{f0} X_{k_1}' M_{f0} X_{k_2})\). This matrix appears as the approximate Hessian in the profile
objective expansion in theorem 4.1, i.e., the condition \( \text{plim}_{N,T \to \infty} W_{NT} > 0 \) is very natural in the context of the interactive fixed effect models, and one may wonder whether also for the general case one can replace assumption 4 with this weaker condition and still obtain consistency of the LS estimator. Unfortunately, this is not the case, and below we present two simple counter examples that show this.

(i) Let there only be one factor \( (R = 1) f_i^0 \) with corresponding factor loadings \( \lambda_i^0 \). Let there only be one regressor \( (K = 1) \) of the form \( X_{it} = w_i v_t + \lambda_i^0 f_i^0 \). Assume the \( N \times 1 \) vector \( w = (w_1, \ldots, w_N)' \), and the \( T \times 1 \) vector \( v = (v_1, \ldots, v_N)' \) are such that the \( N \times 2 \) matrix \( \Lambda = (\lambda^0, w) \) and and the \( T \times 2 \) matrix \( F = (f^0, v) \) satisfy \( \text{plim}_{N,T \to \infty} (N \Lambda/N) > 0 \), and \( \text{plim}_{N,T \to \infty} (F'F/T) > 0 \). In this case, we have \( W_{NT} = (NT)^{-1} \text{Tr}(M_{f^0} vv' M_{\lambda^0} vv') \), and therefore \( \text{plim}_{N,T \to \infty} W_{NT} = \text{plim}_{N,T \to \infty} (NT)^{-1} \text{Tr}(M_{f^0} vv' M_{\lambda^0} vv') > 0 \). However, \( \beta \) is not identified because \( \beta^0 X + \lambda^0 f^0w = (\beta^0 + 1)X - vv' \), i.e., it is not possible to distinguish \((\beta, \lambda, f) = (\beta^0, \lambda^0, f^0)\) and \((\beta, \lambda, f) = (\beta^0 + 1, -w, v)\). This implies that the LS estimator is not consistent (both \( \beta^0 \) and \( \beta^0 + 1 \) could be the true parameter, but the LS estimator cannot be consistent for both).

(ii) Let there only be one factor \( (R = 1) f_i^0 \) with corresponding factor loadings \( \lambda_i^0 \). Let the \( N \times 1 \) vectors \( \lambda^0, w_1 \) and \( w_2 \) be such that \( \Lambda = (\lambda^0, w_1, w_2) \) satisfies \( \text{plim}_{N,T \to \infty} (N \Lambda/N) > 0 \). Let the \( T \times 1 \) vectors \( f^0, v_1 \) and \( v_2 \) be such that \( F = (f^0, v_1, v_2) \) satisfies \( \text{plim}_{N,T \to \infty} (F'F/T) > 0 \). Let there be four regressors \( (K = 4) \) defined by \( X_1 = w_1 v_1', X_2 = w_2 v_2', X_3 = (w_1 + \lambda^0)(v_2 + f^0)', X_4 = (w_2 + \lambda^0)(v_1 + f^0)' \). In this case, one can easily check \( \text{plim}_{N,T \to \infty} W_{NT} > 0 \). However, again \( \beta_k \) is not identified, because \( \sum_{k=1}^4 \beta_k X_k + \lambda^0 f^0w = \sum_{k=1}^4 (\beta_k^0 + 1) X_k - (\lambda^0 + w_1 + w_2)(f^0v_1 + v_1 + v_2)' \), i.e., we cannot distinguish between the true parameters and \((\beta, \lambda, f) = (\beta^0 + 1, -\lambda^0 - w_1 - w_2, f^0v_1 + v_1 + v_2)\). Again, as a consequence the LS estimator is not consistent in this case.

In example (ii), there are only low-rank regressors with \( \text{rank}(X_i) = 1 \). One can easily check assumption 4 is not satisfied for this example. In example (i) the regressor is a low-rank regressor with \( \text{rank}(X) = 2 \). In our present version of assumption 4 we only consider low-rank regressors with \( \text{rank}(X) = 1 \), but (as already noted in a footnote in the main paper) it is straightforward to extend the assumption and the consistency proof to low-rank regressors with rank larger than one. Independent of whether we extend the assumption or not, the regressor \( X \) of example (i) fails to satisfy assumption 4. This justifies our formulation of assumption 4, because it shows in general the assumption cannot be replaced by the weaker condition \( \text{plim}_{N,T \to \infty} W_{NT} > 0 \).
S.4 Some Matrix Algebra (including Proof of Lemma A.1)

The following statements are true for real matrices (throughout the whole paper and supplementary material we never use complex numbers anywhere). Let $A$ be an arbitrary $n \times m$ matrix. In addition to the operator (or spectral) norm $\|A\|$ and to the Frobenius (or Hilbert-Schmidt) norm $\|A\|_F$, it is also convenient to define the 1-norm, the $\infty$-norm, and the max-norm by

$$\|A\|_1 = \max_{j=1 \ldots m} \sum_{i=1}^{n} |A_{ij}|, \quad \|A\|_\infty = \max_{i=1 \ldots n} \sum_{j=1}^{m} |A_{ij}|, \quad \|A\|_{\max} = \max_{i=1 \ldots n} \max_{j=1 \ldots m} |A_{ij}|.$$

Lemma S.4.1 (Some useful inequalities). Let $A$ be an $n \times m$ matrix, $B$ be an $m \times p$ matrix, and $C$ and $D$ be $n \times n$ matrices. Then we have:

(i) $\|A\| \leq \|A\|_F \leq \|A\| \text{rank}(A)^{1/2}$,
(ii) $\|AB\| \leq \|A\| \|B\|$,
(iii) $\|AB\|_F \leq \|A\|_F \|B\| \leq \|A\|_F \|B\|_F$,
(iv) $|\text{Tr}(AB)| \leq \|A\|_F \|B\|_F$, for $n = p$,
(v) $|\text{Tr}(C)| \leq \|C\| \text{rank}(C)$,
(vi) $\|C\| \leq \text{Tr}(C)$, for $C$ symmetric and $C \geq 0$,
(vii) $\|A\|^2 \leq \|A\|_1 \|A\|_\infty$,
(viii) $\|A\|_{\max} \leq \|A\| \leq \sqrt{nm} \|A\|_{\max}$,
(ix) $\|A'CA\| \leq \|A'DA\|$, for $C$ symmetric and $C \leq D$.

For $C$, $D$ symmetric, and $i = 1, \ldots, n$ we have:

(x) $\mu_i(C) + \mu_i(D) \leq \mu_i(C + D) \leq \mu_i(C) + \mu_1(D)$,
(xi) $\mu_i(C) \leq \mu_i(C + D)$, for $D \geq 0$,
(xii) $\mu_i(C) - \|D\| \leq \mu_i(C + D) \leq \mu_i(C) + \|D\|$.

Proof. Here we use notation $s_i(A)$ for the $i$th largest singular value of a matrix $A$.

(i) We have $\|A\| = s_1(A)$, and $\|A\|^2_F = \sum_{i=1}^{\text{rank}(A)} (s_i(A))^2$. The inequalities follow directly from this representation. (ii) This inequality is true for all unitarily invariant norms, see, e.g., Bhatia (1997). (iii) can be shown as follows

$$\|AB\|^2_F = \text{Tr}((ABB'A')$$

$$= \text{Tr}([|B|^2 AA' - A(|B|^2 I - BB')A']$$

$$\leq \|B\|^2 \text{Tr}(AA') = \|B\|^2 \|A\|^2_F.$$
where we used $A(\|B\|^2 I - BB^t)A'$ is positive definite. Relation (iv) is just the Cauchy Schwarz inequality. To show (v) we decompose $C = UDO'$ (singular value decomposition), where $U$ and $O$ are $n \times \text{rank}(C)$ that satisfy $U'U = O'O = I$ and $D$ is a $\text{rank}(C) \times \text{rank}(C)$ diagonal matrix with entries $s_i(C)$. We then have $\|O\| = \|U\| = 1$ and $\|D\| = \|C\|$ and therefore

$$|\text{Tr}(C)| = |\text{Tr}(UDO')| = |\text{Tr}(DO'U)| = \left| \sum_{i=1}^{\text{rank}(C)} \eta_i D O' U \eta_i \right| \leq \sum_{i=1}^{\text{rank}(C)} \|D\| \|O'\| \|U\| = \text{rank}(C) \|C\|.$$  

For (vi) let $e_1$ be a vector that satisfies $\|e_1\| = 1$ and $\|C\| = e_1^t C e_1$. Because $C$ is symmetric such an $e_1$ has to exist. Now choose $e_i$, $i = 2, \ldots, n$, such that $e_i$, $i = 1, \ldots, n$, becomes an orthonormal basis of the vector space of $n \times 1$ vectors. Because $C$ is positive semi definite we then have $\text{Tr}(C) = \sum_i e_i^t C e_i \geq e_1 C e_1 = \|C\|$, which is what we wanted to show. For (vii) we refer to Golub and van Loan (1996), p.15. For (viii) let $e$ be the vector that satisfies $\|e\| = 1$ and $\|A' C A\| = e^t A' C A e$. Because $A' C A$ is symmetric such an $e$ has to exist. Because $C \leq D$ we then have $\|C\| = (e' A') C (A e) \leq (e' A') D (A e) \leq \|A'D A\|$. This is what we wanted to show. For inequality (ix) let $e_1$ be a vector that satisfied $\|e_1\| = 1$ and $\|A' C A\| = e_1^t A' C A e_1$. Then we have $\|A' C A\| = e_1^t A' D A e_1 - e_1^t A' (D - C) A e_1 \leq e_1^t A' D A e_1 \leq \|A'D A\|$. Statement (x) is a special case of Weyl’s inequality, see, e.g., Bhatia (1997). The inequalities (xi) and (xii) follow directly from (ix) because $\mu_i(D) \geq 0$ for $D \geq 0$, and because $-\|D\| \leq \mu_i(D) \leq \|D\|$ for $i = 1, \ldots, n$.  

**Definition S.4.2.** Let $A$ be an $n \times r_1$ matrix and $B$ be an $n \times r_2$ matrix with $\text{rank}(A) = r_1$ and $\text{rank}(B) = r_2$. The smallest principal angle $\theta_{A,B} \in [0, \pi/2]$ between the linear subspaces $\text{span}(A) = \{Aa | a \in \mathbb{R}^{r_1}\}$ and $\text{span}(B) = \{Bb | b \in \mathbb{R}^{r_2}\}$ of $\mathbb{R}^n$ is defined by

$$\cos(\theta_{A,B}) = \max_{0 \neq a \in \mathbb{R}^{r_1}} \max_{0 \neq b \in \mathbb{R}^{r_2}} \frac{a^t A'^t B b}{\|A a\| \|B b\|}.$$  

**Lemma S.4.3.** Let $A$ be an $n \times r_1$ matrix and $B$ be an $n \times r_2$ matrix with $\text{rank}(A) = r_1$ and $\text{rank}(B) = r_2$. Then we have the following alternative characterizations of the smallest principal angle between $\text{span}(A)$ and $\text{span}(B)$

$$\sin(\theta_{A,B}) = \min_{0 \neq a \in \mathbb{R}^{r_1}} \frac{\|M_B A a\|}{\|A a\|} = \min_{0 \neq b \in \mathbb{R}^{r_2}} \frac{\|M_A B b\|}{\|B b\|}.$$
**Proof.** Because $\|M_B A a\|^2 + \|P_B A a\|^2 = \|A a\|^2$ and $\sin(\theta_{A,B})^2 + \cos(\theta_{A,B})^2 = 1$, we find proving the theorem is equivalent to proving

$$\cos(\theta_{A,B}) = \min_{0 \neq a \in \mathbb{R}^r} \frac{\|P_B A a\|}{\|A a\|} = \min_{0 \neq b \in \mathbb{R}^s} \frac{\|P_A B b\|}{\|A b\|}.$$ 

This last statement is theorem 8 in Galantai and Hegedus (2006), and the proof can be found there. □

**Proof of Lemma A.1.** Let

$$S_1(Z) = \min_{f, \lambda} \text{Tr} [(Z - \lambda f') (Z' - f' \lambda')],$$ $$S_2(Z) = \min_f \text{Tr}(Z M_f Z'),$$ $$S_3(Z) = \min_{\lambda} \text{Tr}(Z' M_\lambda Z),$$ $$S_4(Z) = \min_{\lambda, f} \text{Tr}(M_\lambda Z M_f Z'),$$ $$S_5(Z) = \sum_{i=R+1}^T \mu_i(Z' Z),$$ $$S_6(Z) = \sum_{i=R+1}^N \mu_i(Z Z').$$

The theorem claims

$$S_1(Z) = S_2(Z) = S_3(Z) = S_4(Z) = S_5(Z) = S_6(Z).$$

We find:

(i) The non-zero eigenvalues of $Z'Z$ and $ZZ'$ are identical, so in the sums in $S_5(Z)$ and in $S_6(Z)$ we are summing over identical values, which shows $S_5(Z) = S_6(Z)$.

(ii) Starting with $S_1(Z)$ and minimizing with respect to $f$ we obtain the first-order condition

$$\lambda' Z = \lambda' \lambda f'.$$

Putting this into the objective function we can integrate out $f$, namely

$$\text{Tr} [(Z - \lambda f')' (Z - \lambda f')] = \text{Tr} (Z' Z - Z' \lambda f')$$

$$= \text{Tr} (Z' Z - Z' \lambda (\lambda')^{-1} (\lambda' \lambda) f')$$

$$= \text{Tr} (Z' Z - Z' \lambda (\lambda')^{-1} (\lambda' \lambda) \lambda' Z)$$

$$= \text{Tr} (Z' M_\lambda Z).$$

This shows $S_1(Z) = S_3(Z)$. Analogously, we can integrate out $\lambda$ to obtain $S_1(Z) = S_2(Z)$. 10
(iii) Let $M_{\tilde{\lambda}}$ be the projector on the $N - R$ eigenspaces corresponding to the $N - R$ smallest eigenvalues\(^1\) of $ZZ'$, let $P_{\tilde{\lambda}} = I_N - M_{\tilde{\lambda}}$, and let $\omega_R$ be the $R$'th largest eigenvalue of $ZZ'$. We then know the matrix $P_{\tilde{\lambda}}[ZZ' - \omega_R I_N]P_{\tilde{\lambda}} - M_{\tilde{\lambda}}[ZZ' - \omega_R I_N]M_{\tilde{\lambda}}$ is positive semi-definite. Thus, for an arbitrary $N \times R$ matrix $\lambda$ with corresponding projector $M_\lambda$ we have

$$0 \leq \text{Tr} \left\{ (P_{\tilde{\lambda}}[ZZ' - \omega_R I_N]P_{\tilde{\lambda}} - M_{\tilde{\lambda}}[ZZ' - \omega_R I_N]M_{\tilde{\lambda}}) \left( M_{\lambda} - M_{\tilde{\lambda}} \right)^2 \right\}$$

$$= \text{Tr} \left\{ (P_{\tilde{\lambda}}[ZZ' - \omega_R I_N]P_{\tilde{\lambda}} + M_{\tilde{\lambda}}[ZZ' - \omega_R I_N]M_{\tilde{\lambda}}) \left( M_{\lambda} - M_{\tilde{\lambda}} \right) \right\}$$

$$= \text{Tr} \left[ Z' M_{\lambda} Z \right] - \text{Tr} \left[ Z' M_{\tilde{\lambda}} Z \right] + \omega_R \left[ \text{rank}(M_{\lambda}) - \text{rank}(M_{\tilde{\lambda}}) \right],$$

and because $\text{rank}(M_{\tilde{\lambda}}) = N - R$ and $\text{rank}(M_{\lambda}) \leq N - R$ we have

$$\text{Tr} \left[ Z' M_{\lambda} Z \right] \leq \text{Tr} \left[ Z' M_{\tilde{\lambda}} Z \right].$$

This shows $M_{\tilde{\lambda}}$ is the optimal choice in the minimization problem of $S_3(Z)$, i.e., the optimal $\lambda = \tilde{\lambda}$ is chosen such that the span of the $N$-dimensional vectors $\tilde{\lambda}_r$ ($r = 1 \ldots R$) equals to the span of the $R$ eigenvectors that correspond to the $R$ largest eigenvalues of $ZZ'$. This shows $S_3(Z) = S_6(Z)$. Analogously one can show $S_2(Z) = S_5(Z)$.

(iv) In the minimization problem in $S_4(Z)$ we can choose $\tilde{\lambda}$ such that the span of the $N$-dimensional vectors $\tilde{\lambda}_r$ ($r = 1 \ldots R_1$) is equal to the span of the $R_1$ eigenvectors that correspond to the $R_1$ largest eigenvalues of $ZZ'$. In addition, we can choose $\tilde{f}$ such that the span of the $T$-dimensional vectors $\tilde{f}_r$ ($r = 1 \ldots R_2$) is equal to the span of the $R_2$ eigenvectors that correspond to the $(R_1 + 1)$-largest up to the $R$-largest eigenvalue of $Z'Z$. With this choice of $\tilde{\lambda}$ and $\tilde{f}$ we actually project out all the $R$ largest eigenvalues of $Z'Z$ and $ZZ'$. This shows that $S_4(Z) \leq S_5(Z)$. (This result is actually best understood by using the singular value decomposition of $Z$.)

We can write $M_{\tilde{\lambda}} Z M_{\tilde{f}} = Z - \tilde{Z}$, where

$$\tilde{Z} = P_{\tilde{\lambda}} Z M_{\tilde{f}} + Z P_{\tilde{f}}.$$

Because $\text{rank}(Z) \leq \text{rank}(P_{\tilde{\lambda}} Z M_{\tilde{f}}) + \text{rank}(Z P_{\tilde{f}}) = R_1 + R_2 = R$, we can always write

---

\(^1\)If an eigenvalue has multiplicity $m$, we count it $m$ times when finding the $N - R$ smallest eigenvalues. In this terminology we always have exactly $N$ eigenvalues of $ZZ'$, but some may appear multiple times.
\( \tilde{Z} = \lambda f' \) for some appropriate \( N \times R \) and \( T \times R \) matrices \( \lambda \) and \( f \). This shows that

\[
S_4(Z) = \min_{\lambda, f} \text{Tr}(M\lambda Z M_f Z') \\
\geq \min_{\{\tilde{Z} : \text{rank}(Z) \leq R\}} \text{Tr}((Z - \tilde{Z})(Z - \tilde{Z}')) \\
= \min_{f, \lambda} \text{Tr} [(Z - \lambda f')(Z' - f\lambda')] = S_1(Z).
\]

Thus we have shown here \( S_1(Z) \leq S_4(Z) \leq S_5(Z) \), and this holds with equality because \( S_1(Z) = S_5(Z) \) was already shown above.

\[ \Box \]

### S.5 Supplement to the Consistency Proof (Appendix A)

**Lemma S.5.1.** Under assumptions 1 and 4 there exists a constant \( B_0 > 0 \) such that for the matrices \( w \) and \( v \) introduced in assumption 4 we have

\[
w' M_{\lambda^0} w - B_0 w' w \geq 0, \quad \text{wpa1,} \\
v' M_{f^0} v - B_0 v' v \geq 0, \quad \text{wpa1.}
\]

**Proof.** We can decompose \( w = \tilde{w} \tilde{w}' \), where \( \tilde{w} \) is an \( N \times \text{rank}(w) \) matrix and \( \tilde{w} \) is a \( \text{rank}(w) \times K_1 \) matrix. Note \( \tilde{w} \) has full rank, and \( M_w = M_{\tilde{w}} \).

By assumption 1(i) we know \( \lambda^0 \lambda^0 / N \) has a probability limit, i.e., there exists some \( B_1 > 0 \) such that \( \lambda^0 \lambda^0 / N < B_1, \text{wpa1.} \) Using this and assumption 4 we find for any \( R \times 1 \) vector \( a \neq 0 \) we have

\[
\frac{\|M_w \lambda^0 a\|^2}{\|\lambda^0 a\|^2} = \frac{a' \lambda^0 M_w \lambda^0 a}{a' \lambda^0 \lambda^0 a} > \frac{B}{B_1}, \quad \text{wpa1.}
\]

Applying Lemma S.4.3 we find

\[
\min_{0 \neq b \in \mathbb{R}^{\text{rank}(w)}} \frac{b' \tilde{w}' M_{\lambda^0} \tilde{w} b}{b' \tilde{w}' \tilde{w} b} = \min_{0 \neq a \in \mathbb{R}^R} \frac{a' \lambda^0 M_w \lambda^0 a}{a' \lambda^0 \lambda^0 a} > \frac{B}{B_1}, \quad \text{wpa1.}
\]

Therefore we find for every \( \text{rank}(w) \times 1 \) vector \( b \) that \( b' (\tilde{w}' M_{\lambda^0} \tilde{w} - (B/B_1) \tilde{w}' \tilde{w}) b > 0, \text{wpa1.} \)

Thus \( \tilde{w}' M_{\lambda^0} \tilde{w} - (B/B_1) \tilde{w}' \tilde{w} > 0, \text{wpa1.} \) Multiplying from the left with \( \tilde{w}' \) and from the right with \( \tilde{w} \) we obtain \( w' M_{\lambda^0} w - (B/B_1) w' w \geq 0, \text{wpa1.} \) This is what we wanted to show. Analogously we can show the statement for \( v \).

As a consequence of the this lemma we obtain some properties of the low-rank regressors summarized in the following lemma.
Lemma S.5.2. Let the assumptions 1 and 4 be satisfied and let $X_{\text{low}, \alpha} = \sum_{i=1}^{K_1} \alpha_i X_i$ be a linear combination of the low-rank regressors. Then there exists some constant $B > 0$ such that

$$
\min_{\{\alpha \in \mathbb{R}^{K_1}, \|\alpha\| = 1\}} \frac{\|X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}'\|}{N T} > B, \quad \text{wpa1},
$$

$$
\min_{\{\alpha \in \mathbb{R}^{K_1}, \|\alpha\| = 1\}} \frac{\|M_{\lambda^0} X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}' M_{\lambda^0}\|}{N T} > B, \quad \text{wpa1}.
$$

Proof. Note $\|M_{\lambda^0} X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}' M_{\lambda^0}\| \leq \|X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}'\|$, because $\|M_{\lambda^0}\| = 1$, i.e., if we can show the second inequality of the lemma we have also shown the first inequality.

We can write $X_{\text{low}, \alpha} = w \text{diag}(\alpha') v'$. Using Lemma S.5.1 and part (v), (vi) and (ix) of Lemma S.4.1 we find

$$
\|M_{\lambda^0} X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}' M_{\lambda^0}\| = \|M_{\lambda^0} w \text{diag}(\alpha') v' M_{f^0} v \text{diag}(\alpha') w' M_{\lambda^0}\|
$$

$$
\geq B_0 \|M_{\lambda^0} w \text{diag}(\alpha') v' v \text{diag}(\alpha') w' M_{\lambda^0}\|
$$

$$
\geq \frac{B_0}{K_1} \text{Tr} [M_{\lambda^0} w \text{diag}(\alpha') v' v \text{diag}(\alpha') w' M_{\lambda^0}]
$$

$$
= \frac{B_0}{K_1} \text{Tr} [v \text{diag}(\alpha') w' M_{\lambda^0} v \text{diag}(\alpha') v']
$$

$$
\geq \frac{B_0}{K_1} \|v \text{diag}(\alpha') w' M_{\lambda^0} v \text{diag}(\alpha') v'\|
$$

$$
\geq \frac{B_0}{K_1^2} \|v \text{diag}(\alpha') w' w \text{diag}(\alpha') v'\|
$$

$$
\geq \frac{B_0}{K_1^3} \text{Tr} [v \text{diag}(\alpha') w' w \text{diag}(\alpha') v']
$$

$$
= \frac{B_0}{K_1^3} \text{Tr} [X_{\text{low}, \alpha} X_{\text{low}, \alpha}'] .
$$

Thus we have $\|M_{\lambda^0} X_{\text{low}, \alpha} M_{f^0} X_{\text{low}, \alpha}' M_{\lambda^0}\|/(N T) \geq (B_0/K_1)^2 \alpha' W_{NT}^{\text{low}_N^\alpha}$, where the $K_1 \times K_1$ matrix $W_{NT}^{\text{low}_N^\alpha}$ is defined by $W_{NT}^{\text{low}_N^\alpha} = (N T)^{-1} \text{Tr} (X_i X_i')$, i.e., it is a submatrix of $W_{NT}$. Because $W_{NT}$ and thus $W_{NT}^{\text{low}_N^\alpha}$ converges to a positive definite matrix the lemma is proven by the inequality above.

Using the above lemmas we can now prove the lower bound on $\tilde{S}^{(2)}_{NT}(\beta, f)$ that was used in the consistency proof. Remember

$$
\tilde{S}^{(2)}_{NT}(\beta, f) = \frac{1}{N T} \text{Tr} \left[ \left( \lambda^0 f^{0\alpha} + \sum_{k=1}^{K} (\beta_k^0 - \beta_k) X_k \right) M_f \left( \lambda^0 f^{0\alpha} + \sum_{k=1}^{K} (\beta_k^0 - \beta_k) X_k \right)' P(\lambda^0, w) \right] .
$$
We want to show under the assumptions of theorem 3.1 there exist finite positive constants \(a_0, a_1, a_2, a_3\) and \(a_4\) such that

\[
\widetilde{S}_{NT}^{(2)}(\beta, f) \geq \frac{a_0 \| \beta^{\text{low}} - \beta^{0,\text{low}} \|^2}{\| \beta^{\text{low}} - \beta^{0,\text{low}} \|^2 + a_1 \| \beta^{\text{low}} - \beta^{0,\text{low}} \| + a_2} - a_3 \| \beta^{\text{high}} - \beta^{0,\text{high}} \| - a_4 \| \beta^{\text{high}} - \beta^{0,\text{high}} \| \| \beta^{\text{low}} - \beta^{0,\text{low}} \| , \quad \text{wpal.}
\]

**Proof of the lower bound on \(\widetilde{S}_{NT}^{(2)}(\beta, f)\).** Applying Lemma A.1 and part (xi) of Lemma S.4.1 we find

\[
\widetilde{S}_{NT}^{(2)}(\beta, f) \geq \frac{1}{NT} \mu_{R+1} \left[ \left( \lambda^0 f^{0r} + \sum_{k=1}^K (\beta^0_k - \beta_k) X_k \right)' P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{k=1}^K (\beta^0_k - \beta_k) X_k \right) \right] \]

\[
= \frac{1}{NT} \mu_{R+1} \left[ \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)' \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right) \right.
\]

\[
+ \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)' P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)
\]

\[
+ \sum_{m=K_1}^K (\beta^0_m - \beta_m) X_m P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)
\]

\[
+ \sum_{m=K_1}^K (\beta^0_m - \beta_m) X_m P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)
\]

\[
\geq \frac{1}{NT} \mu_{R+1} \left[ \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)' \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right) \right.
\]

\[
+ \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)' P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)
\]

\[
+ \sum_{m=K_1}^K (\beta^0_m - \beta_m) X_m P_{(\lambda^0, w)} \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)
\]

\[
\geq \frac{1}{NT} \mu_{R+1} \left[ \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right)' \left( \lambda^0 f^{0r} + \sum_{l=1}^{K_1} (\beta^0_l - \beta_l) w_l v_l' \right) \right.
\]

\[
- a_3 \| \beta^{\text{high}} - \beta^{0,\text{high}} \| - a_4 \| \beta^{\text{high}} - \beta^{0,\text{high}} \| \| \beta^{\text{low}} - \beta^{0,\text{low}} \| , \quad \text{wpal},
\]

where \(a_3 > 0\) and \(a_4 > 0\) are appropriate constants. For the last step we used part (xii) of
Lemma S.4.1 and the fact that
\[
\frac{1}{NT} \left\| \sum_{m=K_1}^{K} (\beta_m^0 - \beta_m) X_m' P_{(\lambda^0, w)} \left( \lambda^0 f^0 + \sum_{l=1}^{K_1} (\beta_l^0 - \beta_l) w_l v_l' \right) \right\|
\leq K \left\| \beta^{\text{high}} - \beta^{0, \text{high}} \right\| \max_{m} \left\| X_m / \sqrt{NT} \right\| \left( \left\| \lambda^0 f^0 / \sqrt{NT} \right\| + K \left\| \beta^{\text{low}} - \beta^{0, \text{low}} \right\| \max_{l} \left\| w_l v_l' \right\| \right).
\]

Our assumptions guarantee the operator norms of $\lambda^0 f^0 / \sqrt{NT}$ and $X_m / \sqrt{NT}$ are bounded from above as $N, T \to \infty$, which results in finite constants $a_3$ and $a_4$.

We write the above result as
\[
\tilde{S}_{NT}^{(2)}(\beta, f) \geq \mu_{R+1}(A'A) / (NT) + \text{terms containing } \beta^{\text{high}},
\]
where we defined $A = \lambda^0 f^0 + \sum_{l=1}^{K_1} (\beta_l^0 - \beta_l) w_l v_l'$. We also write $A = A_1 + A_2 + A_3$, with $A_1 = M_w A P_0 = M_w \lambda^0 f^0$, $A_2 = P_w A M_0 = \sum_{l=1}^{K_1} (\beta_l^0 - \beta_l) w_l v_l' M_0$, $A_3 = P_w A P_0 = P_w \lambda^0 f^0 + \sum_{l=1}^{K_1} (\beta_l^0 - \beta_l) w_l v_l' P_0$. We then find $A'A = A_1 A_1 + (A_2 + A_3)(A_2 + A_3)$ and
\[
A'A \geq A'A - (a^{1/2} A_3' + a^{-1/2} A_2')(a^{1/2} A_3 + a^{-1/2} A_2)
= [A_1 A_1 - (a - 1) A_3' A_3] + (1 - a^{-1}) A_2' A_2,
\]
where $\geq$ for matrices refers to the difference being positive definite, and $a$ is a positive number. We choose $a = 1 + \mu_R(A_1 A_1) / (2 \| A_3 \|^2)$. The reason for this choice becomes clear below.

Note $[A_1' A_1 - (a - 1) A_3' A_3]$ has at most rank $R$ (asymptotically it has exactly rank $R$). The non-zero eigenvalues of $A'A$ are therefore given by the (at most) $R$ non-zero eigenvalues of $[A_1' A_1 - (a - 1) A_3' A_3]$ and the non-zero eigenvalues of $(1 - a^{-1}) A_2' A_2$, the largest one of the latter being given by the operator norm $(1 - a^{-1})\|A_2\|^2$. We therefore find
\[
\frac{1}{NT} \mu_{R+1}(A'A) \geq \frac{1}{NT} \mu_{R+1} \left( (A_1' A_1 - (a - 1) A_3' A_3) + (1 - a^{-1}) A_2' A_2 \right)
\geq \frac{1}{NT} \min \left( (1 - a^{-1})\|A_2\|^2, \mu_R [A_1' A_1 - (a - 1) A_3' A_3] \right).
\]

Using Lemma S.4.1(xii) and our particular choice of $a$ we find
\[
\mu_R [A_1' A_1 - (a - 1) A_3' A_3] \geq \mu_R(A_1' A_1) - \| (a - 1) A_3' A_3 \|
= \frac{1}{2} \mu_R(A_1' A_1).
\]

Therefore
\[
\frac{1}{NT} \mu_{R+1}(A'A) \geq \frac{1}{2 NT} \mu_R(A_1' A_1) \min \left\{ 1, \frac{2 \| A_2 \|^2}{2 \| A_3 \|^2 + \mu_R(A_1' A_1)} \right\}
\geq \frac{1}{NT} \frac{\| A_2 \|^2 \mu_R(A_1' A_1)}{2 \| A_3 \|^2 + \mu_R(A_1' A_1)},
\]

15
where we used $\|A\| \geq \|A_3\|$ and $\|A\| \geq \|A_2\|$.

Our assumptions guarantee there exist positive constants $c_0$, $c_1$, $c_2$, and $c_3$ such that

$$\frac{\|A\|}{\sqrt{NT}} \leq \frac{\|A^0 f^0\|}{\sqrt{NT}} + \sum_{l=1}^{K_1} |\beta_0^l - \beta_{l_1}| \frac{\|w_l v'_l\|}{\sqrt{NT}} \leq c_0 + c_1 \|\beta_{\text{low}} - \beta_{\text{0,low}}\|, \text{ wpal},$$

$$\frac{\mu_R(A'A)}{NT} = \mu_R \left( \frac{f^0 A^0 M_w A^0 f^0}{NT} \right) \geq c_2, \text{ wpal},$$

$$\frac{\|A_2\|^2}{NT} = \mu_1 \left[ \sum_{l_1=1}^{K_1} (\beta_0^l - \beta_{l_1}) w_{l_1} v'_{l_1} M_{f^0} \sum_{l_2=1}^{K_1} (\beta_0^l - \beta_{l_2}) v_{l_2} w'_{l_2} \right] \geq c_3 \|\beta_{\text{low}} - \beta_{\text{0,low}}\|^2, \text{ wpal},$$

were for the last inequality we used Lemma S.5.2.

We thus have

$$\frac{1}{NT} \mu_{R+1} (A'A) \geq \frac{c_3 \|\beta_{\text{low}} - \beta_{\text{0,low}}\|^2}{1 + \frac{2}{c_2} \left( c_0 + c_1 \|\beta_{\text{low}} - \beta_{\text{0,low}}\| \right) \|^2}, \text{ wpal}.$$ 

Defining $a_0 = \frac{c_2 c_3}{2 c_1}$, $a_1 = \frac{2 c_0}{c_1}$ and $a_2 = \frac{c_2}{2 c_1}$ we thus obtain

$$\frac{1}{NT} \mu_{R+1} (A'A) \geq \frac{a_0 \|\beta_{\text{low}} - \beta_{\text{0,low}}\|^2}{\|\beta_{\text{low}} - \beta_{\text{0,low}}\|^2 + a_1 \|\beta_{\text{low}} - \beta_{\text{0,low}}\| + a_2}, \text{ wpal},$$

i.e., we have shown the desired bound on $\tilde{S}_{NT}^{(2)}(\beta, f)$. \hfill \qed

### S.6 Regarding the Proof of Corollary 4.2

As discussed in the main text, the proof of Corollary 4.2 is provided in Moon and Weidner (2015). All that is left to show here is the matrix $W_{NT} = W_{NT}(\lambda^0, f^0, X_k)$ does not become singular as $N, T \to \infty$ under our assumptions.

**Proof.** Remember

$$W_{NT} = \frac{1}{NT} \text{Tr}(M_{f^0} X'_k M_{\lambda^0} X_k) .$$
The smallest eigenvalue of the symmetric matrix $W(\lambda^0, f^0, X_k)$ is given by

$$
\mu_K(W_{NT}) = \min_{\{a \in \mathbb{R}^K, a \neq 0\}} \frac{a' W_{NT} a}{\|a\|^2}
$$

$$
= \min_{\{a \in \mathbb{R}^K, a \neq 0\}} \frac{1}{NT} \left\{ \right. \\
+ \left. \frac{1}{\|\alpha\|^2 + \|\varphi\|^2} \right\}
$$

$$
= \min_{\{\alpha \in \mathbb{R}^{K_1}, \varphi \in \mathbb{R}^{K_2}, \alpha \neq 0, \varphi \neq 0\}} \frac{1}{NT} \left\{ \right. \\
+ \left. \frac{1}{\|\alpha\|^2 + \|\varphi\|^2} \right\}
$$

where we decomposed $a = (\varphi', \alpha')'$, with $\varphi$ and $\alpha$ being vectors of length $K_1$ and $K_2$, respectively, and we defined linear combinations of high- and low-rank regressors:

$$
X_{\text{low,} \varphi} = \sum_{l=1}^{K_1} \varphi_l X_l, \quad X_{\text{high,} \alpha} = \sum_{m=K_1+1}^{K} \alpha_m X_m.
$$

We have $M_{\lambda^0} = M(\lambda^0, w) + P(M_{\lambda^0} w)$, where $w$ is the $N \times K_1$ matrix defined in assumption 4, i.e., $(\lambda^0, w)$ is an $N \times (R + K_1)$ matrix, whereas $M_{\lambda^0} w$ is also an $N \times K_1$ matrix. Using this we obtain

$$
\mu_K(W_{NT})
$$

$$
= \min_{\{\varphi \in \mathbb{R}^{K_1}, \alpha \in \mathbb{R}^{K_2}, \varphi \neq 0, \alpha \neq 0\}} \frac{1}{NT} \left\{ \right. \\
+ \left. \frac{1}{\|\alpha\|^2 + \|\varphi\|^2} \right\}
$$

$$
= \min_{\{\varphi \in \mathbb{R}^{K_1}, \alpha \in \mathbb{R}^{K_2}, \varphi \neq 0, \alpha \neq 0\}} \frac{1}{NT} \left\{ \right. \\
+ \left. \frac{1}{\|\alpha\|^2 + \|\varphi\|^2} \right\}
$$

\[\text{(S.6.1)}\]

\[\text{As in assumption 4 the components of } \alpha \text{ are denoted } \alpha_{K_1+1}, \ldots, \alpha_K \text{ to simplify notation.}\]
We note there exists finite positive constants $c_1$, $c_2$, and $c_3$ such that

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{low, } \phi} \right] \geq \frac{1}{NT} \| \alpha \| ^2 , \quad \text{wpal},$$

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} \left( X_{\text{low, } \phi} + X_{\text{high, } \alpha} \right) P_{(M_{\lambda}, w)} \left( X_{\text{low, } \phi} + X_{\text{high, } \alpha} \right) \right] \geq 0 ,$$

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{low, } \phi} P_{(M_{\lambda}, w)} X_{\text{low, } \phi} \right] \geq c_2 \| \phi \| ^2 , \quad \text{wpal},$$

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{high, } \alpha} P_{(M_{\lambda}, w)} X_{\text{high, } \alpha} \right] \geq - \frac{c_3}{2} \| \phi \| \| \alpha \| , \quad \text{wpal},$$

$$(S.6.2)$$

and we want to justify these inequalities now. The second and the last equation in (S.6.2) are true because, e.g., $\text{Tr} \left[ M_{f_0} X_{\text{high, } \alpha} P_{(M_{\lambda}, w)} X_{\text{high, } \alpha} \right] = \text{Tr} \left[ M_{f_0} X_{\text{high, } \alpha} P_{(M_{\lambda}, w)} X_{\text{high, } \alpha} M_{f_0} \right]$, and the trace of a symmetric positive semi-definite matrix is non-negative. The first inequality in (S.6.2) is true because $\text{rank}(f_0) + \text{rank}(\lambda, w) = 2R + K_1$ and using Lemma A.1 and assumption 4 we have

$$\frac{1}{NT} \| \alpha \|^2 \text{Tr} \left[ M_{f_0} X_{\text{high, } \alpha} M_{(\lambda, w)} X_{\text{high, } \alpha} \right] \geq \frac{1}{NT} \| \alpha \|^2 \mu_{2R+K_1+1} \left[ X_{\text{high, } \alpha} X_{\text{high, } \alpha} \right] > b , \quad \text{wpal},$$

i.e., we can set $c_1 = b$. The third inequality in (S.6.2) is true because according Lemma S.4.1(v) we have

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{low, } \phi} P_{(M_{\lambda}, w)} X_{\text{high, } \alpha} \right] \geq - \frac{K_1}{NT} \| X_{\text{low, } \phi} \| \| X_{\text{high, } \alpha} \|$$

$$\geq - \frac{K_1}{NT} \| X_{\text{low, } \phi} \| _F \| X_{\text{high, } \alpha} \| _F$$

$$\geq - K_1 K_2 \| \phi \| \| \alpha \| \max_{k_1=1 \ldots k_1} \frac{X_{k_1}}{\sqrt{NT}} \max_{k_2=K_1+1 \ldots K_2} \frac{X_{k_2}}{\sqrt{NT}}$$

$$\geq - \frac{c_3}{2} \| \phi \| \| \alpha \| ,$$

where we used that assumption 4 implies $\| X_k / \sqrt{NT} \| _F < C$ holds wpal for some constant $C$ as, and we set $c_3 = K_1 K_2 C^2$. Finally, we have to argue that the third inequality in (S.6.2) holds. Note $X_{\text{low, } \phi} P_{(M_{\lambda}, w)} X_{\text{low, } \phi} = X_{\text{low, } \phi} M_{\lambda} X_{\text{low, } \phi}$, i.e., we need to show

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{low, } \phi} M_{\lambda} X_{\text{low, } \phi} \right] \geq c_2 \| \phi \|^2 .$$

Using part (vi) of Lemma S.4.1 we find

$$\frac{1}{NT} \text{Tr} \left[ M_{f_0} X_{\text{low, } \phi} M_{\lambda} X_{\text{low, } \phi} \right] = \frac{1}{NT} \text{Tr} \left[ M_{\lambda} X_{\text{low, } \phi} M_{f_0} X_{\text{low, } \phi} M_{\lambda} \right]$$

$$\geq \frac{1}{NT} \left\| M_{\lambda} X_{\text{low, } \phi} M_{f_0} X_{\text{low, } \phi} M_{\lambda} \right\| ,$$

18
and according to Lemma S.5.2 this expression is bounded by some positive constant times $\|\varphi\|^2$ (in the lemma we have $\|\varphi\| = 1$, but all expressions are homogeneous in $\|\varphi\|$).

Using the inequalities (S.6.2) in equation (S.6.1) we obtain

$$
\mu_K(W_{NT}) \geq \min_{\{\varphi \in \mathbb{R}^{K_1}, \alpha \in \mathbb{R}^{K_2}, \varphi \neq 0, \alpha \neq 0\}} \frac{1}{\|\varphi\|^2 + \|\alpha\|^2} \left\{ c_1\|\alpha\|^2 + \max\left[0, c_2\|\varphi\|^2 - c_3\|\varphi\||\|\alpha\||\right]\right\}
$$

$$
\geq \min \left( \frac{c_2}{2}, \frac{c_1c_2}{c_2^2 + c_3^2} \right), \text{ w.p.a.1.}
$$

Thus, the smallest eigenvalue of $W_{NT}$ is bounded from below by a positive constant as $N, T \to \infty$, i.e., $W_{NT}$ is non-degenerate and invertible. 

\section*{S.7 Proof of Examples for Assumption 5}

\textbf{Proof of Example 1.} We want to show the conditions of Assumption 5 are satisfied. Conditions (i)-(iii) are satisfied by the assumptions of the example.

For condition (iv), notice $\text{Cov}(X_{it}, X_{is}|C) = \mathbb{E}(U_{it}U_{is})$. Because $|\beta^0| < 1$ and $\sup_{it} \mathbb{E}(e_{it}^2) < \infty$, it follows

$$
\frac{1}{NT} \sum_{i=1}^{N} \sum_{t,s=1}^{T} |\text{Cov}(X_{it}, X_{is}|C)| = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t,s=1}^{T} |\mathbb{E}(U_{it}U_{is})| = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t,s=1}^{T} \sum_{p,q=0}^{\infty} |(\beta^0)^{p+q} \mathbb{E}(e_{it-p}e_{is-q})| < \infty.
$$

For condition (v), notice by the independence between the sigma field $C$ and the error terms
\{e_{it}\} that we have for some finite constant \(M\),

\[
\frac{1}{NT^2} \sum_{t,s,u,v=1}^T \left| \text{Cov} \left( e_{it} \tilde{X}_{is}, e_{iu} \tilde{X}_{iv} \right) \right|
= \frac{1}{NT^2} \sum_{t,s,u,v=1}^T \left| \text{Cov} \left( e_{it} U_{is}, e_{iu} U_{iv} \right) \right|
= \frac{1}{NT^2} \sum_{t,s,u,v=1}^T \sum_{p,q=0}^\infty \sum_{i=1}^N \left( \beta_0^p \right)^{p+q} \text{E} \left( e_{it} e_{is-p} e_{iu} e_{iv-q} \right) - \left( \beta_0^p \right)^p \text{E} \left( e_{it} e_{is-p} \right) \left( \beta_0^q \right)^q \text{E} \left( e_{iu} e_{iv-q} \right)
\leq \frac{M}{T^2} \sum_{t,s,u,v=1}^T \sum_{p,q=0}^\infty \sum_{i=1}^N \left( \beta_0^p \right)^{p+q} \left[ \{t = u\} \{s - p = v - q\} + \{t = v - q\} \{s - p = u\} \right]
= \frac{M}{T^2} \sum_{t,u,s,v=1}^T \sum_{k = -\infty}^\infty \sum_{l = -\infty}^\infty \left| \beta_0^p \right|^{s-k+v-l} \{t = u\} \{k = l\} + M \left( \frac{1}{T} \sum_{s,u=1}^T \left| \beta_0^p \right|^{s-u} \right) \left( \frac{1}{T} \sum_{v,t=1}^T \left| \beta_0^q \right|^{v-t} \right)
= \frac{M}{T^2} \sum_{s,v=1}^T \sum_{k = -\infty}^\infty \left| \beta_0^p \right|^{s+v-2k} + M \left( \frac{1}{T} \sum_{s,u=1}^T \left| \beta_0^p \right|^{s-u} \right) \left( \frac{1}{T} \sum_{v,t=1}^T \left| \beta_0^q \right|^{v-t} \right).
\]

Notice

\[
\frac{1}{T} \sum_{s,v=1}^T \sum_{k = -\infty}^\infty \left| \beta_0^p \right|^{s+v-2k}
= \frac{2}{T} \sum_{s=2}^T \sum_{v=1}^s \left| \beta_0^p \right|^{s-v+2(v-k)} + \frac{2}{T} \sum_{s=1}^T \sum_{k = -\infty}^\infty \left| \beta_0^p \right|^{2(s-k)}
= \frac{2}{T} \sum_{s=2}^T \sum_{v=1}^s \left| \beta_0^p \right|^{s-v} \sum_{l = 0}^\infty \left| \beta_0^p \right|^{2l} + \frac{2}{T} \sum_{s=1}^T \sum_{l = 0}^\infty \left| \beta_0^p \right|^{2l}
= \frac{2}{1 - \left| \beta_0^p \right|^2} \frac{1}{T} \sum_{s=2}^T \sum_{t=1}^s \left| \beta_0^p \right|^{s-v} + \frac{2}{1 - \left| \beta_0^p \right|^2}
= \left( \frac{2}{1 - \left| \beta_0^p \right|^2} \right) \sum_{l = 1}^{T-1} \left| \beta_0^p \right|^l \left( 1 - \frac{l}{T} \right) + \frac{2}{1 - \left| \beta_0^p \right|^2}
= O(1),
\]

and

\[
\frac{1}{T} \sum_{s,u=1}^T \sum_{s-u=0}^T \left| \beta_0^p \right|^{s-u} = \frac{1}{T} \sum_{s=1}^T \sum_{u=1}^s \left| \beta_0^p \right|^{s-u} = \sum_{l = 0}^{T-1} \left| \beta_0^p \right|^l \left( 1 - \frac{l}{T} \right) = O(1).
\]
Therefore, we have the desired result
\[
\frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} |\text{Cov} \left( e_{it} \tilde{X}_{is}, e_{iu} \tilde{X}_{iv} | \mathcal{C} \right)| = O_p(1).
\]

Preliminaries for Proof of Example 2

• Although we observe \( X_{it} \) for \( 1 \leq t \leq T \), here we treat \( Z_{it} = (e_{it}, X_{it}) \) as having an infinite past and future. Define

\[
G^t_\tau(i) = \mathcal{C} \vee \sigma \left( \{X_{is} : \tau \leq s \leq t \} \right) \quad \text{and} \quad H^t_\tau(i) = \mathcal{C} \vee \sigma \left( \{Z_{it} : \tau \leq s \leq t \} \right).
\]

Then, by definition, we have \( G^t_\tau(i), H^t_\tau(i) \subset F^t_\tau(i) \) for all \( \tau,t,i \).

• Mixing inequality: The following inequality is a conditional version of the \( \alpha \)-mixing inequality of Hall and Heyde (1980), p. 278. Suppose \( X_{it} \) is a \( \mathcal{F}_t \)-measurable random variable with \( \mathbb{E} \left( |X_{it}|^{\max\{p,q\}} | \mathcal{C} \right) < \infty \), where \( p,q > 1 \) with \( 1/p + 1/q < 1 \). Denote \( \|X_{it}\|_{\mathcal{C},p} = (\mathbb{E}(|X_{it}|^p | \mathcal{C}))^{1/p} \). Then, for each \( i \), we have

\[
|\text{Cov} (X_{it}, X_{it+m} | \mathcal{C})| \leq 8 \|X_{it}\|_{\mathcal{C},p} \|X_{it+m}\|_{\mathcal{C},q} \alpha_m(i)^{1-\frac{1}{p}-\frac{1}{q}} \cdot (S.7.1)
\]

Proof of Example 2. Again, we want to show the conditions of Assumption 5 are satisfied. Conditions (i)-(iii) are satisfied by the assumptions of the example.

For condition (iv), we apply the mixing inequality (S.7.1) with \( p = q > 4 \). Then, we have

\[
\frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} \left| \text{Cov} (X_{it}, X_{is} | \mathcal{C}) \right| \leq \frac{2}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} \sum_{m=0}^{T-t} \left| \text{Cov} (X_{it}, X_{it+m} | \mathcal{C}) \right| = \frac{2}{NT} \sum_{i=1}^{N} \sum_{m=0}^{T-1} \sum_{t=1}^{T-m} \left| \text{Cov} (X_{it}, X_{it+m} | \mathcal{C}) \right|
\]

\[
= \frac{16}{NT} \sum_{i=1}^{N} \sum_{m=0}^{T-1} \sum_{t=1}^{T-m} \|X_{it}\|_{\mathcal{C},p} \|X_{it+m}\|_{\mathcal{C},q} \alpha_m(i)^{\frac{p-2}{2}}
\]

\[
\leq 16 \left( \sup_{i,t} \|X_{it}\|_{\mathcal{C},p}^2 \right) \sum_{m=0}^{\infty} \alpha_m \frac{p-2}{2}
\]

\[
\leq O_p(1),
\]
where the last line holds because \( \sup_{t,s,t} \| X_{it} \|_{c,p}^2 = O_p(1) \) for some \( p > 4 \) as assumed in the example (2), and \( \sum_{m=0}^{\infty} \frac{m^2}{\alpha_m} = \sum_{m=0}^{\infty} m^{-\zeta} = O(1) \) because of \( \zeta > \frac{4p}{4p-1} \) and \( p > 4 \).

For condition (v), we need to show
\[
\frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} |Cov(e_{it} \tilde{X}_{is}, e_{iu} \tilde{X}_{iv}|C)| = O_p(1).
\]

Notice
\[
\frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} |Cov(e_{it} \tilde{X}_{is}, e_{iu} \tilde{X}_{iv}|C)|
= \frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} \left| \mathbb{E}(e_{it} X_{is} e_{iu} X_{iv}|C) - \mathbb{E}(e_{it} \tilde{X}_{is}|C) \mathbb{E}(e_{iu} \tilde{X}_{iv}|C) \right|
\leq \frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} \left| \mathbb{E}(e_{it} \tilde{X}_{is} e_{iu} \tilde{X}_{iv}|C) \right| + \frac{1}{N} \sum_{i=1}^{N} \left( \frac{1}{T} \sum_{t,s=1}^{T} \mathbb{E}(e_{it} \tilde{X}_{is}|C) \right)^2
= I + II, \text{ say.}
\]

First, for term \( I \), there are a finite number of different orderings among the indices \( t, s, u, v \). We consider the case \( t \leq s \leq u \leq v \) and establish the desired result. The other cases can be shown analogously. Note
\[
\frac{1}{NT^2} \sum_{i=1}^{N} \sum_{t=1}^{T} \sum_{k=0}^{T-t} \sum_{l=0}^{T-k} \sum_{m=0}^{T-l} \left| \mathbb{E}(e_{it} \tilde{X}_{it+k} e_{it+k+l+k} \tilde{X}_{it+k+l+m}|C) \right|
\leq \frac{1}{N} \sum_{i=1}^{N} \frac{1}{T^2} \sum_{t=1}^{T} \sum_{k=0}^{T-t} \sum_{l=0}^{T-k} \sum_{m=0}^{T-l} \left| \mathbb{E}(e_{it} \tilde{X}_{it+k} e_{it+k+l+k} \tilde{X}_{it+k+l+m}|C) \right|
+ \frac{1}{N} \sum_{i=1}^{N} \frac{1}{T^2} \sum_{t=1}^{T} \sum_{k=0}^{T-t} \sum_{l=0}^{T-k} \sum_{m=0}^{T-l} \left| \mathbb{E}\left(\left(e_{it} \tilde{X}_{it+k}\right)\left(e_{it+k+l+k} \tilde{X}_{it+k+l+m}|C\right)\right) \right| \left| \mathbb{E}(e_{it+k+l} \tilde{X}_{it+k+l+m}|C) \right|
+ \frac{1}{N} \sum_{i=1}^{N} \frac{1}{T^2} \sum_{t=1}^{T} \sum_{k=0}^{T-t} \sum_{l=0}^{T-k} \sum_{m=0}^{T-l} \left| \mathbb{E}(e_{it+k} \tilde{X}_{it+k+l+k} \mathbb{E}(e_{it+k+l} \tilde{X}_{it+k+l+m}|C) \right| \left| \mathbb{E}(e_{it+k+l} \tilde{X}_{it+k+l+m}|C) \right|
+ \frac{1}{N} \sum_{i=1}^{N} \frac{1}{T^2} \sum_{t=1}^{T} \sum_{k=0}^{T-t} \sum_{l=0}^{T-k} \sum_{m=0}^{T-l} \left| \mathbb{E}\left(\left(e_{it} \tilde{X}_{it+k} e_{it+k+l+k} \tilde{X}_{it+k+l+m}|C\right)\right) \right|
\]
\[
= I_1 + I_2 + I_3 + I_4, \text{ say.}
\]
By applying the mixing inequality (S.7.1) to \( \mathbb{E} \left( e_{it} \left( \tilde{X}_{it+k} e_{it+k+l} \tilde{X}_{it+k+l+m} \right) | \mathcal{C} \right) \) with \( e_{it} \) and \( \tilde{X}_{it+k} e_{it+k+l} \tilde{X}_{it+k+l+m} \), we have

\[
\mathbb{E} \left( e_{it} \left( \tilde{X}_{it+k} e_{it+k+l} \tilde{X}_{it+k+l+m} \right) | \mathcal{C} \right) \\
\leq 8 \left\| e_{it} \right\|_{c,p} \left\| \tilde{X}_{it+k} \right\|_{c,p} \left\| e_{it+k+l} \right\|_{c,p} \left\| \tilde{X}_{it+k+l+m} \right\|_{c,p} \alpha_k^{1-\frac{1}{p}-\frac{1}{q}}(i)
\]

where the last inequality follows by the generalized Holder’s inequality. Choose \( p = 3q > 4 \).

Then,

\[
I_1 \leq \frac{8}{N} \sum_{i=1}^{N} \frac{1}{T^2} \sum_{t=1}^{T} \sum_{0 \leq k, m \leq q \leq k+l+m \leq T-t} \left\| e_{it} \right\|_{c,p} \left\| \tilde{X}_{it+k} \right\|_{c,p} \left\| e_{it+k+l} \right\|_{c,p} \left\| \tilde{X}_{it+k+l+m} \right\|_{c,p} \alpha_k^{1-\frac{1}{p}}(i)
\]

\[
\leq 8 \left( \sup_{i,t} \| e_{it} \|_{c,p}^2 \right) \left( \sup_{i,t} \| \tilde{X}_{it+k} \|_{c,p}^2 \right) \frac{1}{T^2} \sum_{t=1}^{T} \sum_{0 \leq k, m \leq q \leq k+l+m \leq T-t} \alpha_k^{1-\frac{1}{p}}
\]

\[
\leq 8 \left( \sup_{i,t} \| e_{it} \|_{c,p}^2 \right) \left( \sup_{i,t} \| \tilde{X}_{it+k} \|_{c,p}^2 \right) \sum_{k=0}^{\infty} k^2 \alpha_k^{1-\frac{1}{p}} = \mathcal{O}_p(1),
\]

where the last line holds because we assume in example (2) that \( \left( \sup_{i,t} \| e_{it} \|_{c,p}^2 \right) \left( \sup_{i,t} \| \tilde{X}_{it+k} \|_{c,p}^2 \right) = \mathcal{O}_p(1) \) for some \( p > 4 \), and \( \sum_{m=0}^{\infty} m^2 \alpha_m^{1-\frac{1}{p}} = \sum_{m=0}^{\infty} m^2 \alpha_m^{\frac{4p-4}{4p-1}} = O(1) \) because of \( \zeta > 3 \frac{4p-4}{4p-1} \) and \( p > 4 \).

By applying similar arguments, we can also show

\[
I_2, I_3, I_4 = \mathcal{O}_p(1).
\]

**S.8 Supplement to the Proof of Theorem 4.3**

**Notation \( \mathbb{E}_c \) and \( \text{Var}_c \) and \( \text{Cov}_c \):** In the remainder of this supplementary file we write \( \mathbb{E}_c \), \( \text{Var}_c \) and \( \text{Cov}_c \) for the expectation, variance and covariance operators conditional on \( c \), i.e., \( \mathbb{E}_c(A) = \mathbb{E}(A|C) \), \( \text{Var}_c(A) = \text{Var}(A|C) \) and \( \text{Cov}_c(A, B) = \text{Cov}(A, B|C) \).

What is left to show to complete the proof of Theorem 4.3 is that Lemma B.1 and Lemma B.2 in the main text appendix hold. Before showing this, we first present two further intermediate lemmas.
Lemma S.8.1. Under the assumptions of Theorem 4.3 we have for \( k = 1, \ldots, K \),

\[
\begin{align*}
(a) & \quad \|P_{\lambda^0 \tilde{X}_k}\| = o_p(\sqrt{NT}), \\
(b) & \quad \|\tilde{X}_k P_{f^0}\| = o_p(\sqrt{NT}), \\
(c) & \quad \|P_{\lambda^0 e X'_k}\| = o_p(N^{3/2}), \\
(d) & \quad \|P_{\lambda^0 e P_{f^0}}\| = O_p(1).
\end{align*}
\]

Proof of Lemma S.8.1. # Part (a): We have

\[
\|P_{\lambda^0 \tilde{X}_k}\| = \|\lambda^0 (\lambda^0 \lambda^0)^{-1} \lambda^0 \tilde{X}_k\|
\leq \|\lambda^0 (\lambda^0 \lambda^0)^{-1}\| \|\lambda^0 \tilde{X}_k\|
\leq \|\lambda^0\| \|\lambda^0\|^{-1} \|\lambda^0 \tilde{X}_k\|_F = O_p(N^{-1/2}) \|\lambda^0 \tilde{X}_k\|_F,
\]

where we used part (i) and (ii) of Lemma S.4.1 and Assumption 1. We have

\[
\mathbb{E} \left\{ \mathbb{E}_C \left[ \|\lambda^0 \tilde{X}_k\|_F^2 \right] \right\} = \mathbb{E} \left\{ \sum_{r=1}^R \sum_{t=1}^T \mathbb{E}_C \left[ \left( \sum_{i=1}^N \lambda_{it}^0 \tilde{X}_{k, it} \right)^2 \right] \right\}
\]

\[
= \mathbb{E} \left\{ \sum_{r=1}^R \sum_{t=1}^T \sum_{i=1}^N (\lambda_{it}^0)^2 \mathbb{E}_C \left( \tilde{X}_{k, it}^2 \right) \right\}
\]

\[
= \sum_{r=1}^R \sum_{t=1}^T \sum_{i=1}^N \mathbb{E} \left[ (\lambda_{it}^0)^2 \text{Var}_C \left( X_{k, it} \right) \right]
= O_p(NT),
\]

where we used \( \tilde{X}_{k, it} \) is mean zero and independent across \( i \), conditional on \( C \), and our bounds on the moments of \( \lambda_{ir}^0 \) and \( X_{k, it} \). We therefore have \( \|\lambda^0 \tilde{X}_k\|_F = O_p(\sqrt{NT}) \) and the above inequality thus gives \( \|P_{\lambda^0 \tilde{X}_k}\| = O_p(\sqrt{NT}) = o_p(\sqrt{NT}) \).

# The proof for part (b) is similar. As above we first obtain \( \|\tilde{X}_k P_{f^0}\| = \|P_{f^0} \tilde{X}'_k\| \leq O_p(T^{-1/2}) \|f^0 \tilde{X}'_k\|_F \). Next, we have

\[
\mathbb{E}_C \left[ \|f^0 \tilde{X}'_k\|_F^2 \right] = \sum_{r=1}^R \sum_{i=1}^N \mathbb{E}_C \left[ \left( \sum_{t=1}^T f_{it}^0 \tilde{X}_{k, it} \right)^2 \right]
\]

\[
= \sum_{r=1}^R \sum_{i=1}^N \sum_{t, s=1}^T f_{it}^0 f_{is}^0 \mathbb{E}_C \left( \tilde{X}_{k, it} \tilde{X}_{k, is} \right)
\]

\[
\leq \left[ \sum_{r=1}^R \left( \max_t |f_{it}^0| \right)^2 \right] \sum_{i=1}^N \sum_{t, s=1}^T |\text{Cov}_C \left( X_{k, it}, X_{k, is} \right)|
= O_p(T^{2/(4+\epsilon)}) O_p(NT) = o_p(NT^2),
\]

24
where we used that uniformly bounded $\mathbb{E}\|f_t^0\|^{4+\epsilon}$ implies $\max_t |f_t^0| = O_p(T^{1/(4+\epsilon)})$. We thus have $\|f^0\tilde{X}_k\|_F^2 = o_p(T\sqrt{N})$ and therefore $\|X_kP^0\| = o_p(\sqrt{NT})$.

# Next, we show part (c). First, we have
\[
\mathbb{E}\left\{ \mathbb{E}_C \left[ \left( \|\lambda^0 eX_k'\|_F \right)^2 \right] \right\} = \mathbb{E} \left\{ \mathbb{E}_C \left[ \sum_{r=1}^R \sum_{j=1}^N \left( \sum_{i=1}^N \sum_{t=1}^T \lambda^0_{ir} e_{it} X_{k,jt} \right)^2 \right] \right\}
\]
\[
= \mathbb{E} \left\{ \sum_{r=1}^R \sum_{i,j}^N \sum_{t,s=1}^T \lambda^0_{ir} \lambda^0_{is} \mathbb{E}_C \left( e_{it} e_{js} X_{k,jt} X_{k,js} \right) \right\}
\]
\[
= \sum_{r=1}^R \sum_{i,j}^N \sum_{t=1}^T \mathbb{E} \left[ \left( \lambda^0_{ir} \right)^2 \mathbb{E}_C \left( e_{it}^2 X_{k,jt}^2 \right) \right] = O(N^2T)
\]
where we used that $\mathbb{E}_C \left( e_{it} e_{js} X_{k,jt} X_{k,js} \right)$ is only non-zero if $i = l$ (because of cross-sectional independence conditional on $C$) and $t = s$ (because regressors are pre-determined). We can thus conclude $\|\lambda^0 eX_k'\|_F = O_p(N\sqrt{T})$. Using this we find
\[
\|P_{\chi_{\lambda}^0}eX_k'\| = \|\lambda^0 (\lambda^0 \lambda^0)^{-1} \lambda^0 eX_k'\|
\]
\[
\leq \|\lambda^0 (\lambda^0 \lambda^0)^{-1}\| \|\lambda^0 eX_k'\|
\]
\[
\leq \|\lambda^0\| \|\lambda^0 \lambda^0\|^{-1} \|\lambda^0 eX_k'\|_F = O_p(N^{-1/2})O_p(N\sqrt{T}) = O_p(\sqrt{NT})
\]
This is what we wanted to show.

# For part (d), we first find $\frac{1}{\sqrt{NT}} \|f^0 e\lambda^0\|_F = O_p(1)$, because
\[
\mathbb{E} \left\{ \mathbb{E}_C \left[ \left( \frac{\|f^0 e\lambda^0\|_F}{\sqrt{NT}} \right)^2 \right] \right\} = \mathbb{E} \left\{ \frac{1}{NT} \mathbb{E}_C \left[ \left( \sum_{i=1}^N \sum_{t=1}^T e_{it} f^0_{it} \lambda^0_{it} \right)^2 \right] \right\}
\]
\[
= \mathbb{E} \left\{ \frac{1}{NT} \sum_{i=1}^N \sum_{j=1}^N \sum_{t=1}^T \sum_{s=1}^T \mathbb{E}_C (e_{it} e_{js} f^0_{it} \lambda^0_{it} \lambda^0_{js} f^0_{js}) \right\}
\]
\[
= \frac{1}{NT} \sum_{i=1}^N \sum_{t=1}^T \mathbb{E} \left[ \mathbb{E}_C \left( e_{it}^2 \right) f^0_{it} \lambda^0_{it} \lambda^0_{it} f^0_{it} \right]
\]
\[
= O(1)
\]
where we used $e_{it}$ is independent across $i$ and over $t$, conditional on $C$. Thus we obtain
\[
\|P_{\chi_{\lambda}^0}P^0\| = \|\lambda^0 (\lambda^0 \lambda^0)^{-1} \lambda^0 e f^0 (f^0 \lambda^0)^{-1} f^0\|
\]
\[
\leq \|\lambda^0\| \|\lambda^0 \lambda^0\|^{-1} \|\lambda^0 e f^0\| \| (f^0 \lambda^0)^{-1} \| \| f^0\|
\]
\[
\leq O_p(N^{1/2})O_p(N^{-1})\|\lambda^0 e f^0\|_F O_p(T^{-1})O_p(T^{1/2}) = O_p(1)
\]
where we used part (i) and (ii) of Lemma S.4.1.
Lemma S.8.2. Suppose $A$ and $B$ are $T \times T$ and $N \times N$ matrices that are independent of $e$, conditional on $C$, such that $\mathbb{E}_C (\|A\|_F^2) = \mathcal{O}_p (NT)$ and $\mathbb{E}_C (\|B\|_F^2) = \mathcal{O}_p (NT)$, and let Assumption 5 be satisfied. Then there exists a finite non-random constant $c_0$ such that

\[
\begin{align*}
(a) & \quad \mathbb{E}_C \left( \{ \text{Tr} \left[ (e'e - \mathbb{E}_C (e'e)) A_t \right] \}^2 \right) \leq c_0 N \mathbb{E}_C (\|A\|_F^2), \\
(b) & \quad \mathbb{E}_C \left( \{ \text{Tr} \left[ (ee' - \mathbb{E}_C (ee')) B_t \right] \}^2 \right) \leq c_0 T \mathbb{E}_C (\|B\|_F^2). 
\end{align*}
\]

Proof. Part (a): Denote $A_{ts}$ to be the $(t,s)^{th}$ element of $A$. We have

\[
\text{Tr} \left\{ (e'e - \mathbb{E}_C (e'e)) A_t \right\} = \sum_{t=1}^T \sum_{s=1}^T (e'e - \mathbb{E}_C (e'e))_{ts} A_{ts} \\
= \sum_{t=1}^T \sum_{s=1}^T \left( \sum_{i=1}^N (e_{it}e_{is} - \mathbb{E}_C (e_{it}e_{is})) \right) A_{ts}.
\]

Therefore,

\[
\mathbb{E}_C (\text{Tr} \left\{ (e'e - \mathbb{E}_C (e'e)) A_t \right\})^2 \\
= \sum_{t=1}^T \sum_{s=1}^T \sum_{p=1}^T \sum_{q=1}^T \mathbb{E}_C \left( \sum_{i=1}^N (e_{it}e_{is} - \mathbb{E}_C (e_{it}e_{is})) \right) \mathbb{E}_C \left( \sum_{j=1}^N (e_{jp}e_{jq} - \mathbb{E}_C (e_{jp}e_{jq})) \right) \mathbb{E}_C (A_{ts}A_{pq}).
\]

Let $\Sigma_{it} = \mathbb{E}_C (e_{it}^2)$. Then we find

\[
\mathbb{E}_C \left\{ \left( \sum_{i=1}^N (e_{it}e_{is} - \mathbb{E}_C (e_{it}e_{is})) \right) \left( \sum_{j=1}^N (e_{jp}e_{jq} - \mathbb{E}_C (e_{jp}e_{jq})) \right) \right\} \\
= \sum_{i=1}^N \sum_{j=1}^N \left\{ \mathbb{E}_C (e_{it}e_{is}e_{jp}e_{jq}) - \mathbb{E}_C (e_{it}e_{is}) \mathbb{E}_C (e_{jp}e_{jq}) \right\} \\
= \begin{cases} \\
\Sigma_{it} \Sigma_{is} & \text{if } (t = p) \neq (s = q) \text{ and } (i = j) \\
\Sigma_{it} \Sigma_{is} & \text{if } (t = q) \neq (s = p) \text{ and } (i = j) \\
\mathbb{E}_C (e_{it}^2) - \Sigma_{it}^2 & \text{if } (t = s = p = q) \text{ and } (i = j) \\
0 & \text{otherwise.}
\end{cases}
\]

Therefore,

\[
\mathbb{E}_C (\text{Tr} \left\{ (e'e - \mathbb{E}_C (e'e)) A_t \right\})^2 \\
\leq \sum_{t=1}^T \sum_{s=1}^T \sum_{i=1}^N \Sigma_{it} \Sigma_{is} (\mathbb{E}_C (A_{ts}^2) + \mathbb{E}_C (A_{ts}A_{st})) + \sum_{t=1}^T \sum_{i=1}^N (\mathbb{E}_C (e_{it}^4) - \Sigma_{it}^2) \mathbb{E}_C A_{tt}^2.
\]
Define $\Sigma^i = \text{diag}(\Sigma_{i1}, ..., \Sigma_{iT})$. Then, we have
\[
\sum_{t=1}^{T} \sum_{s=1}^{T} \sum_{i=1}^{N} \Sigma_{it} \Sigma_{is} (E_C A_{is}^2) = E_C \left( \sum_{i=1}^{N} \text{Tr} \left( A^i \Sigma^i A^j \right) \right) 
\leq \sum_{i=1}^{N} E_C \| A^i \|_F^2 \leq \sum_{i=1}^{N} \| \Sigma^i \|_F^2 E_C \| A \|_F^2 
\leq N \left( \sup_{it} \Sigma_{it}^2 \right) E_C \| A \|_F^2. \tag{S.8.1}
\]

Also,
\[
\sum_{t=1}^{T} \sum_{s=1}^{T} \sum_{i=1}^{N} \Sigma_{it} \Sigma_{is} E_C (A_{ts} A_{st}) = E_C \left[ \sum_{i=1}^{N} \text{Tr} \left( \Sigma^i A A^i \right) \right] 
\leq \sum_{i=1}^{N} E_C \| \Sigma^i A \|_F \| A \Sigma^i \|_F \leq \sum_{i=1}^{N} \| \Sigma^i \|_F^2 E_C \| A \|_F^2 
\leq N \left( \sup_{it} \Sigma_{it}^2 \right) E_C \| A \|_F^2. \tag{S.8.2}
\]

Finally,
\[
\sum_{t=1}^{T} \sum_{i=1}^{N} \left( E_C (e_{it}^4) - \Sigma_{it}^2 \right) E_C A_{it}^2 \leq N \left( \sup_{it} E_C (e_{it}^4) \right) E_C \| A \|_F^2, \tag{S.8.3}
\]
and $\sup_{it} E_C (e_{it}^4)$ is assumed bounded by Assumption 5(vi).

# Part (b): The proof is analogous to the proof of part (a). \[ \square \]

**Proof of Lemma B.1.** # For part (a) we have
\[
\left| \frac{1}{\sqrt{NT}} \text{Tr} \left( P_{\theta o} e' P_{\lambda o} \tilde{X}_k \right) \right| = \left| \frac{1}{\sqrt{NT}} \text{Tr} \left( P_{\theta o} e' P_{\lambda o} P_{\lambda o} \tilde{X}_k P_{\theta o} \right) \right| 
\leq \frac{R}{\sqrt{NT}} \| P_{\lambda o} e P_{\theta o} \| \| P_{\lambda o} \tilde{X}_k \| \| P_{\theta o} \|
\leq \frac{1}{\sqrt{NT}} O_p(1) o_p(\sqrt{NT}) O_p(1)
= o_p(1),
\]
where the second-last equality follows by Lemma S.8.1 (a) and (d).

# To show statement (b) we define $\zeta_{k,ijt} = e_{it} \tilde{X}_{k,jt}$. We then have
\[
\frac{1}{\sqrt{NT}} \text{Tr} \left( P_{\lambda o} e \tilde{X}_k^i \right) = \sum_{r,q=1}^{R} \left[ \left( \frac{\lambda^0 o^0}{N} \right)^{-1} \right]_{rq} \frac{1}{N \sqrt{NT}} \sum_{t=1}^{T} \sum_{i,j=1}^{N} \lambda^0 o^0 \lambda_{jr} \zeta_{k,ijt}.
\equiv A_{k,rq}
\]
We only have \( \mathbb{E}_C(\zeta_{k,ij}\zeta_{k,lm}) \neq 0 \) if \( t = s \) (because regressors are pre-determined) and \( i = l \) and \( j = m \) (because of cross-sectional independence). Therefore

\[
\mathbb{E}\left\{ \mathbb{E}_C(A_{k,rq}^2) \right\} = \mathbb{E}\left\{ \frac{1}{N^3T} \sum_{t=1}^{T} \sum_{i,j,l,m=1}^{N} \lambda_{ir}\lambda_{jq}\lambda_{ir}\lambda_{mq} \mathbb{E}_C(\zeta_{k,ij}\zeta_{k,lm}) \right\} = \frac{1}{N^3T} \sum_{t=1}^{T} \sum_{i,j=1}^{N} \mathbb{E}\left[ \lambda_{ir}^2\lambda_{jq}^2 \mathbb{E}_C(\zeta_{k,ij}^2) \right] = O(1/N) = o_p(1).
\]

We thus have \( A_{k,rq} = o_p(1) \) and therefore also \( \frac{1}{\sqrt{NT}} \text{Tr}\left(P_{\lambda^0} e\tilde{X}_k^r\right) = o_p(1)\).

# The proof for statement (c) is similar to the proof of statement (b). Define \( \xi_{k,its} = e_{it}\tilde{X}_{k,its} - \mathbb{E}_C(e_{it}\tilde{X}_{k,its}) \). We then have

\[
\frac{1}{\sqrt{NT}} \text{Tr}\left\{ P_{\lambda^0} \left[ e'\tilde{X}_k - \mathbb{E}_C(e'\tilde{X}_k) \right] \right\} = \sum_{r,q=1}^{R} \left[ \left( \frac{f'f}{T} \right)^{-1} \right]_{rq} \frac{1}{T\sqrt{NT}} \sum_{t=1}^{N} \sum_{i,j=1}^{T} f_{tr}f_{sq}\xi_{k,its}. \]

Therefore

\[
\mathbb{E}_C(B_{k,rq}^2) = \frac{1}{T^3N} \sum_{i,j=1}^{N} \sum_{t,s,u,v=1}^{T} f_{tr}f_{sq}f_{ur}f_{vq} \mathbb{E}_C(\xi_{k,its}\xi_{k,juv}) \leq \left( \max_{t,r} |f_{tr}| \right)^4 \frac{1}{T^3N} \sum_{i,j=1}^{N} \sum_{t,s,u,v=1}^{T} \text{Cov}_C(e_{it}\tilde{X}_{k,its}, e_{ju}\tilde{X}_{k,juv}) \right| \leq \frac{1}{T^3N} \sum_{i=1}^{N} \sum_{t,s,u,v=1}^{T} \text{Cov}_C(e_{it}\tilde{X}_{k,its}, e_{iu}\tilde{X}_{k,juv}) \right| = O_p(T^{1/(4+\epsilon)})O_p(1/T) = o_p(1),
\]

where we used uniformly bounded \( \mathbb{E}\|f_t^0\|^{4+\epsilon} \) implies \( \max_t |f_t^0| = o_p(T^{1/(4+\epsilon)}) \).

# Part (d) and (e): We have \( \|\lambda^0(\lambda^0'\lambda^0)^{-1}(f^0 f^0)^{-1} 1^0\| = O_p((NT)^{-1/2}) \), \( \|\xi\| = O_p(N^{1/2}) \), \( \|X_k\| = O_p(\sqrt{NT}) \) and \( \|P_{\lambda^0} e P_{\lambda^0}\| = O_p(1) \), which was shown in Lemma S.8.1. Therefore:

\[
\frac{1}{\sqrt{NT}} \text{Tr}\left(eP_{\lambda^0} e' M_{\lambda^0} X_k f^0 (f^0 f^0)^{-1} (\lambda^0'\lambda^0)^{-1} \lambda^0\right) = \frac{1}{\sqrt{NT}} \text{Tr}\left(P_{\lambda^0} e P_{\lambda^0} e' M_{\lambda^0} X_k f^0 (f^0 f^0)^{-1} (\lambda^0'\lambda^0)^{-1} \lambda^0\right) \leq \frac{R}{\sqrt{NT}} \|P_{\lambda^0} e P_{\lambda^0}\| \|\xi\| \|X_k\| \|f^0 (f^0 f^0)^{-1} (\lambda^0'\lambda^0)^{-1} \lambda^0\| = O_p(N^{-1/2}) = o_p(1).
\]
which shows statement (d). The proof for part (e) is analogous.

# To prove statement (f) we need to use in addition \(\|P_{\lambda^0} e X_k'\| = o_p(N^{3/2})\), which was also shown in Lemma S.8.1. We find

\[
\frac{1}{\sqrt{NT}} \text{Tr} \left( e' M_{\lambda^0} X_k M_{f^0} e' X_k (\lambda^0 \lambda^0)^{-1} (f^{0^r} f^{0^r})^{-1} f^{0^r} \right) \\
= \frac{1}{\sqrt{NT}} \text{Tr} \left( e' M_{\lambda^0} X_k e' P_{\lambda^0} X_k (\lambda^0 \lambda^0)^{-1} (f^{0^r} f^{0^r})^{-1} f^{0^r} \right) \\
- \frac{1}{\sqrt{NT}} \text{Tr} \left( e' M_{\lambda^0} X_k P_{f^0} e' P_{\lambda^0} X_k (\lambda^0 \lambda^0)^{-1} (f^{0^r} f^{0^r})^{-1} f^{0^r} \right) \\
\leq \frac{R}{\sqrt{NT}} \| e || P_{\lambda^0} e X_k' || \| (\lambda^0 \lambda^0)^{-1} (f^{0^r} f^{0^r})^{-1} f^{0^r} \| \\
- \frac{R}{\sqrt{NT}} \| e || P_{\lambda^0} e P_{f^0} || \| (\lambda^0 \lambda^0)^{-1} (f^{0^r} f^{0^r})^{-1} f^{0^r} \| \\
= o_p(1).
\]

# Now we want to prove part (g) and (h) of the present lemma. For part (g) we have

\[
\frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} \\
= \frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} \\
+ \frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k P_{f^0} f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} \\
= \frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} \\
+ \frac{1}{\sqrt{NT}} \| e' - \mathbb{E}_C(e'e') \| \| X_k P_{f^0} \| \| f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \| \\
= \frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} + o_p(1).
\]

Thus, what is left to prove is \(\frac{1}{\sqrt{NT}} \text{Tr} \left\{ [e' - \mathbb{E}_C(e'e')] M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \right\} = o_p(1)\). For this we define

\[
B_k = M_{\lambda^0} X_k f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r}.
\]

Using part (i) and (ii) of Lemma S.4.1 we find

\[
\| B_k \|_F \leq R^{1/2} \| B_k \| \\
\leq R^{1/2} \| X_k \| \| f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \| \\
\leq R^{1/2} \| X_k \|_F \| f^0 (f^{0^r} f^{0^r})^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^{0^r} \|.
\]
and therefore

\[ \mathbb{E}_c (\|B_k\|_F^2) \leq R \| f^0 (f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \|^2 \mathbb{E}_c (\|\mathcal{X}_k\|_F^2) \]

\[ = \mathcal{O}(1) , \]

where we used \( \mathbb{E}_c (\|\mathcal{X}_k\|_F^2) = \mathcal{O}(NT) \), which is true because we assumed uniformly bounded moments of \( \mathcal{X}_{k,i} \). Applying Lemma S.8.2 we therefore find

\[ \mathbb{E}_c \left( \frac{1}{\sqrt{NT}} \text{Tr} \{ [ee' - \mathbb{E}_c (ee')] B_k \} \right)^2 \leq c_0 \frac{T}{NT} \mathbb{E}_c (\|B_k\|_F^2) = o(1) , \]

and thus

\[ \frac{1}{\sqrt{NT}} \text{Tr} \{ [ee' - \mathbb{E}_c (ee')] B_k \} = o_p(1) , \]

which is what we wanted to show. The proof for part (h) is analogous.

**# Part (i)**: Conditional on \( \mathcal{C} \) the expression \( e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}' - \mathbb{E}_c (e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}') \) is mean zero, and it is also uncorrelated across \( i \). This together with the bounded moments that we assume implies

\[ \text{Var}_c \left\{ \frac{1}{\sqrt{NT}} \sum_{i=1}^{N} \sum_{t=1}^{T} [e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}' - \mathbb{E}_c (e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}')] \right\} = o_p(1/N) = o_p(1), \]

which shows the required result.

**# Part (j)**: Define the \( K \times K \) matrix \( A = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}' - \mathbb{E}_c (e_{it}^2 \mathcal{X}_{it} \mathcal{X}_{it}') \). Then we have

\[ \frac{1}{\sqrt{NT}} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 (\mathcal{X}_{it} + \mathcal{X}_{it}) (\mathcal{X}_{it} - \mathcal{X}_{it})' = \frac{1}{2} (A + A'). \]

Let \( B_k \) be the \( N \times T \) matrix with elements \( B_{k,it} = e_{it}^2 (\mathcal{X}_{k,it} + \mathcal{X}_{k,it}) \). We have \( \|B_k\|_F = \mathcal{O}_p(\sqrt{NT}) \), because the moments of \( B_{k,it} \) are uniformly bounded. The components of \( A \) can be written as \( A_{lk} = \frac{1}{NT} \text{Tr}[B_l(\mathcal{X}_k - \mathcal{X}_k)'] \). We therefore have

\[ |A_{lk}| \leq \frac{1}{NT} \text{rank}(\mathcal{X}_k - \mathcal{X}_k) \|B_l\| \|\mathcal{X}_k - \mathcal{X}_k\|. \]

We have \( \mathcal{X}_k - \mathcal{X}_k = \tilde{\mathcal{X}}_k P_{f0} + P_{\lambda_0} \tilde{\mathcal{X}}_k M_{f0} \). Therefore \( \text{rank}(\mathcal{X}_k - \mathcal{X}_k) \leq 2R \) and

\[ |A_{lk}| \leq \frac{2R}{NT} \|B_l\| \left( \|\tilde{\mathcal{X}}_k P_{f0}\| + \|P_{\lambda_0} \tilde{\mathcal{X}}_k M_{f0}\| \right) \]

\[ \leq \frac{2R}{NT} \|B_l\| \left( \|\tilde{\mathcal{X}}_k P_{f0}\| + \|P_{\lambda_0} \tilde{\mathcal{X}}_k\| \right) = \frac{2R}{NT} \mathcal{O}_p(\sqrt{NT}) o_p(\sqrt{NT}) = o_p(1), \]

where we used Lemma S.8.1. This shows the desired result.
Proof of Lemma B.2. Let $c$ be a $K$-vector such that $\|c\| = 1$. The required result follows by the Cramer-Wold device, if we show

$$\frac{1}{\sqrt{NT}} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it} \mathcal{X}_{it}^c \Rightarrow \mathcal{N}(0, c'\Omega c).$$

For this, define $\xi_{it} = e_{it} \mathcal{X}_{it}^c$. Furthermore define $\xi_m = \xi_{M,m} = \xi_{NT,it}$, with $M = NT$ and $m = T(i-1) + t \in \{1, \ldots, M\}$. We then have the following:

(i) Under Assumption 5(i), (ii), (iii) the sequence $\{\xi_m, m = 1, \ldots, M\}$ is a martingale difference sequence under the filtration $\mathcal{F}_m = \mathcal{C} \vee \sigma(\{\xi_n : n < m\})$.

(ii) $\mathbb{E}(\xi_{it}^4)$ is uniformly bounded, because by Assumption 5(vi) $\mathbb{E}_c e_{it}^8$ and $\mathbb{E}_c (\|X_{it}\|^{8+\epsilon})$ are uniformly bounded by a non-random constant (applying Cauchy-Schwarz and the law of iterated expectations).

(iii) $\frac{1}{M} \sum_{m=1}^{M} \xi_m^2 = c' \Omega c + o_p(1)$.

This is true, because firstly under our assumptions we have $\mathbb{E}_c \left\{ \left[ \frac{1}{M} \sum_{m=1}^{M} (\xi_m^2 - \mathbb{E}_c(\xi_m^2)) \right]^2 \right\} = \mathbb{E}_c \left\{ \frac{1}{M^2} \sum_{m=1}^{M} (\xi_m^2 - \mathbb{E}_c(\xi_m^2))^2 \right\} = \mathcal{O}_P(1/M) = o_P(1)$, implying we have $\frac{1}{M} \sum_{m=1}^{M} \xi_m^2 = \mathbb{E}_c(\xi_m^2) + o_p(1)$. We furthermore have $\frac{1}{M} \sum_{m=1}^{M} \mathbb{E}_c(\xi_m^2) = \text{Var}_c(M^{-1/2} \sum_{m=1}^{M} \xi_m)$, and using the result in equation (14) of the main text we find $\text{Var}_c(M^{-1/2} \sum_{m=1}^{M} \xi_m) = \text{Var}_c((NT)^{-1/2} \sum_{i=1}^{N} \sum_{t=1}^{T} \xi_{it}) = c' \Omega c + o_p(1)$.

These three properties of $\{\xi_m, m = 1, \ldots, M\}$ allow us to apply Corollary 5.26 in White (2001), which is based on Theorem 2.3 in Mcleish (1974), to obtain $\frac{1}{\sqrt{M}} \sum_{m=1}^{M} \xi_m \rightarrow_d \mathcal{N}(0, c'\Omega c)$. This concludes the proof, because $\frac{1}{\sqrt{M}} \sum_{m=1}^{M} \xi_m = \frac{1}{\sqrt{NT}} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it} \mathcal{X}_{it}^c$. \(\blacksquare\)

### S.9 Expansions of Projectors and Residuals

The incidental parameter estimators $\hat{f}$ and $\hat{\lambda}$ as well as the residuals $\hat{e}$ enter into the asymptotic bias and variance estimators for the LS estimator $\hat{\beta}$. To describe the properties of $\hat{f}$, $\hat{\lambda}$ and $\hat{e}$, it is convenient to have asymptotic expansions of the projectors $M_\hat{\lambda}(\beta)$ and $M_\hat{f}(\beta)$ that correspond to the minimizing parameters $\hat{\lambda}(\beta)$ and $\hat{f}(\beta)$ in equation (4). Note the minimizing $\hat{\lambda}(\beta)$ and $\hat{f}(\beta)$ can be defined for all values of $\beta$, not only for the optimal value $\beta = \hat{\beta}$. The corresponding residuals are $\hat{e}(\beta) = Y - \beta \cdot X - \hat{\lambda}(\beta) \hat{f}(\beta)$. 

31
Theorem S.9.1. Under Assumptions 1, 3, and 4(i) we have the following expansions

\[ M_{\lambda}(\beta) = M_{\lambda_0} + M_{\lambda,e}^{(1)} + M_{\lambda,e}^{(2)} - \sum_{k=1}^{K} (\beta_k - \beta_k^0) M_{\lambda,k}^{(1)} + M_{\lambda}^{(\text{rem})}(\beta), \]

\[ M_{f}(\beta) = M_{f_0} + M_{f,e}^{(1)} + M_{f,e}^{(2)} - \sum_{k=1}^{K} (\beta_k - \beta_k^0) M_{f,k}^{(1)} + M_{f}^{(\text{rem})}(\beta), \]

\[ \hat{e}(\beta) = M_{\lambda_0} e M_{f_0} + \hat{e}_e^{(1)} - \sum_{k=1}^{K} (\beta_k - \beta_k^0) \hat{e}_k^{(1)} + \hat{e}^{(\text{rem})}(\beta), \]

where the spectral norms of the remainders satisfy for any series \( \eta_{NT} \to 0 \):

\[ \sup_{\{\beta : \|\beta - \beta^0\| \leq \eta_{NT}\}} \left\| M_{\lambda}^{(\text{rem})}(\beta) \right\| = O_p(1), \]

\[ \sup_{\{\beta : \|\beta - \beta^0\| \leq \eta_{NT}\}} \left\| M_{f}^{(\text{rem})}(\beta) \right\| = O_p(1), \]

\[ \sup_{\{\beta : \|\beta - \beta^0\| \leq \eta_{NT}\}} \left\| \hat{e}^{(\text{rem})}(\beta) \right\| = O_p(1), \]

and we have \( \text{rank}(\hat{e}^{(\text{rem})}(\beta)) \leq 7R \), and the expansion coefficients are given by

\[ M_{\lambda,e}^{(1)} = -M_{\lambda_0} e f_0 (f_0 f_0)^{-1} (\lambda_0^0 \lambda_0^{-1} \lambda_0^0 - \lambda_0^0 (\lambda_0^0 \lambda_0^{-1})^{-1} (f_0^0 f_0)^{-1} f_0^0 e' M_{\lambda_0}^0), \]

\[ M_{\lambda,k}^{(1)} = -M_{\lambda_0} X_k f_0 (f_0 f_0)^{-1} (f_0^0 f_0)^{-1} f_0^0 e' M_{\lambda_0}^0, \]

\[ M_{\lambda,e}^{(2)} = M_{\lambda_0} e f_0 (f_0 f_0)^{-1} (f_0^0 f_0)^{-1} (\lambda_0^0 \lambda_0^0)^{-1} \lambda_0^0 e f_0^0 (f_0^0 f_0)^{-1} (\lambda_0^0 \lambda_0^0)^{-1} \lambda_0^0 + \lambda_0^0 (\lambda_0^0 \lambda_0^0)^{-1} f_0^0 f_0^{-1} f_0^0 e' \lambda_0^0 (\lambda_0^0 \lambda_0^0)^{-1} (f_0^0 f_0)^{-1} f_0^0 e' M_{\lambda_0}^0, \]

\[ -M_{\lambda_0} e M_{f_0} e' \lambda_0^0 (\lambda_0^0 \lambda_0^{-1})^{-1} (f_0^0 f_0)^{-1} (\lambda_0^0 \lambda_0^{-1})^{-1} \lambda_0^0 e M_{f_0} e' M_{\lambda_0}^0, \]

\[ -\lambda_0^0 (\lambda_0^0 \lambda_0^{-1})^{-1} (f_0^0 f_0)^{-1} (\lambda_0^0 \lambda_0^{-1})^{-1} \lambda_0^0 e M_{f_0} e' M_{\lambda_0}^0, \]

\[ -M_{\lambda_0} e f_0 (f_0 f_0)^{-1} (f_0^0 f_0)^{-1} f_0^0 e' M_{\lambda_0}^0, \]

\[ + \lambda_0^0 (\lambda_0^0 \lambda_0^{-1})^{-1} f_0^0 f_0^{-1} f_0^0 e' M_{\lambda_0}^0 e f_0^0 (f_0^0 f_0)^{-1} (\lambda_0^0 \lambda_0^{-1})^{-1} \lambda_0^0, \]
analogously

\[
M^{(1)}_{f,e} = - M_{f^0} e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 f^0 - f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e M_{f^0},
\]

\[
M^{(1)}_{f,k} = - M_{f^0} X'_k \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 f^0 - f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 X_k M_{f^0},
\]

\[
M^{(2)}_{f,e} = M_{f^0} e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 \\
+ f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e M_{f^0} \\
- M_{f^0} e' M_{\lambda^0} e f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 \\
- f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 e' M_{\lambda^0} e M_{f^0} \\
- M_{f^0} e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e M_{f^0} \\
+ f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e M_{f^0} e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0,
\]

and finally

\[
\tilde{e}^{(1)}_k = M_{\lambda^0} X_k M_{f^0},
\]

\[
\tilde{e}^{(1)}_e = - M_{\lambda^0} e M_{f^0} e' \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 \\
- \lambda^0 (\lambda^0 \lambda^0)^{-1} (f^0 f^0)^{-1} f^0 e' M_{\lambda^0} e M_{f^0} \\
- M_{\lambda^0} e f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 e M_{f^0}.
\]

**Proof.** The general expansion of \( M_\tilde{\lambda}(\beta) \) is given in Moon and Weidner (2015), and in the theorem we just make this expansion explicit up to a particular order. The result for \( M_\tilde{\beta}(\beta) \) is just obtained by symmetry \((N \leftrightarrow T, \lambda \leftrightarrow f, e \leftrightarrow e', X_k \leftrightarrow X'_k)\). For the residuals \( \tilde{e} \) we have

\[
\tilde{e} = M_\tilde{\lambda} \left( Y - \sum_{k=1}^{K} \tilde{\beta}_k X_k \right) = M_\tilde{\lambda} \left[ e - \left( \tilde{\beta} - \beta^0 \right) \cdot X + \lambda^0 f^0 \right],
\]

and plugging in the expansion of \( M_\tilde{\lambda} \) gives the expansion of \( \tilde{e} \). We have \( \tilde{e}(\beta) = A_0 + \lambda^0 f^0 - \tilde{\lambda}(\beta) \tilde{f}(\beta) \), where \( A_0 = e - \sum_k (\beta_k - \beta^0_k) X_k \). Therefore \( \tilde{e}^{(\text{rem})}(\beta) = A_1 + A_2 + A_3 \) with \( A_1 = A_0 - M_{\lambda^0} A_0 M_{f^0}, A_2 = \lambda^0 f^0 - \tilde{\lambda}(\beta) \tilde{f}(\beta), \) and \( A_3 = -\tilde{e}^{(1)}_e \). We find \( \text{rank}(A_1) \leq 2R, \text{rank}(A_2) \leq 2R, \text{rank}(A_3) \leq 3R \), and thus \( \text{rank}(\tilde{e}^{(\text{rem})}(\beta)) \leq 7R \), as stated in the theorem. \( \blacksquare \)

Having expansions for \( M_\tilde{\lambda}(\beta) \) and \( M_\tilde{\beta}(\beta) \), we also have expansions for \( P_\tilde{\lambda}(\beta) = I_N - M_\tilde{\lambda}(\beta) \) and \( P_\tilde{\beta}(\beta) = I_T - M_\tilde{\beta}(\beta) \). The reason why we give expansions of the projectors and not expansions of \( \tilde{\lambda}(\beta) \) and \( \tilde{\beta}(\beta) \) directly is for the latter we would need to specify a normalization, whereas the projectors are independent of any normalization choice. An expansion for \( \tilde{\lambda}(\beta) \) can, for example, be defined by \( \tilde{\lambda}(\beta) = P_\tilde{\lambda}(\beta) \lambda^0 \), in which case the normalization of \( \tilde{\lambda}(\beta) \) is implicitly defined by the normalization of \( \lambda^0 \).
S.10 Consistency Proof for Bias and Variance Estimators
(Proof of Theorem 4.4)

It is convenient to introduce some alternative notation for Definition 1 in section 4.3 of the main text.

**Definition** Let $\Gamma : \mathbb{R} \to \mathbb{R}$ be the truncation kernel defined by $\Gamma(x) = 1$ for $|x| \leq 1$, and $\Gamma(x) = 0$ otherwise. Let $M$ be a bandwidth parameter that depends on $N$ and $T$. For an $N \times N$ matrix $A$ with elements $A_{ij}$ and a $T \times T$ matrix $B$ with elements $B_{ts}$ we define

(i) the diagonal truncations $A_{\text{truncD}} = \text{diag}[(A_{ii})_{i=1,...,N}]$ and $B_{\text{truncD}} = \text{diag}[(B_{tt})_{t=1,...,T}]$.

(ii) the right-sided Kernel truncation of $B$, which is a $T \times T$ matrix $B_{\text{truncR}}$ with elements $B_{\text{truncR}}_{ts} = \Gamma\left(\frac{s-t}{M}\right)B_{ts}$ for $t < s$, and $B_{\text{truncR}}_{ts} = 0$ otherwise.

Here, we suppress the dependence of $B_{\text{truncR}}$ on the bandwidth parameter $M$. Using this notation we can represent the estimators for the bias in Definition 1 as follows:

$\hat{B}_{1,k} = \frac{1}{N} \text{Tr} \left[ P\hat{f}(\hat{e}'X_k)^{\text{truncR}} \right]$,  
$\hat{B}_{2,k} = \frac{1}{T} \text{Tr} \left[ (\hat{e}'\hat{e})^{\text{truncD}} M\hat{\lambda}X_k \hat{f}(\hat{f}'\hat{f})^{-1}(\hat{\lambda}'\hat{\lambda})^{-1}\hat{\lambda} \right]$,  
$\hat{B}_{3,k} = \frac{1}{N} \text{Tr} \left[ (\hat{e}'\hat{e})^{\text{truncD}} M\hat{\lambda}'X_k'\hat{\lambda}(\hat{\lambda}'\hat{\lambda})^{-1}(\hat{f}'\hat{f})^{-1}\hat{f} \right]$.

Before proving Theorem 4.4 we establish some preliminary results.

**Corollary S.10.1.** Under the Assumptions of Theorem 4.3 we have $\sqrt{NT}(\hat{\beta} - \beta^0) = O_p(1)$.

This corollary directly follows from Theorem 4.3.

**Corollary S.10.2.** Under the Assumptions of Theorem 4.4 we have

$\left\| P\hat{\lambda} - P\lambda^0 \right\| = \left\| M\hat{\lambda} - M\lambda^0 \right\| = O_p(N^{-1/2})$,  
$\left\| P\hat{f} - P\lambda^0 \right\| = \left\| M\hat{f} - M\lambda^0 \right\| = O_p(T^{-1/2})$.

**Proof.** Using $\|e\| = O_p(N^{1/2})$ and $\|X_k\| = O_p(N)$ we find the expansion terms in Theorem S.9.1 satisfy

$\left\| M^{(1)}_{\lambda,e} \right\| = O_p(N^{-1/2})$,  
$\left\| M^{(2)}_{\lambda,e} \right\| = O_p(N^{-1})$,  
$\left\| M^{(1)}_{\lambda,k} \right\| = O_p(1)$.

Together with corollary S.10.1 the result for $\left\| M\hat{\lambda} - M\lambda^0 \right\|$ immediately follows. In addition we have $P\hat{\lambda} - P\lambda^0 = -M\hat{\lambda} + M\lambda^0$. The proof for $M\hat{f}$ and $P\hat{f}$ is analogous. \[\square\]
Lemma S.10.3. Under the Assumptions of Theorem 4.4 we have

\[ A_1 \equiv \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \left( X_{it}X_{it}' - \hat{X}_{it}\hat{X}_{it}' \right) = o_p(1) , \]

\[ A_2 \equiv \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} \left( e_{it}^2 - \hat{e}_{it}^2 \right) \hat{X}_{it}\hat{X}_{it}' = o_p(1) . \]

Lemma S.10.4. Let \( \hat{f} \) and \( f^0 \) be normalized as \( \hat{f}' \hat{f}/T = I_R \) and \( f^0f^0/T = I_R \). Then, under the assumptions of Theorem 4.4, there exists an \( R \times R \) matrix \( H = H_{NT} \) such that\(^3\)

\[ \| \hat{f} - f^0 H \| = O_p(1) , \quad \| \hat{\lambda} - \lambda^0 (H')^{-1} \| = O_p(1) . \]

Furthermore

\[ \| \lambda (\lambda'\lambda)^{-1} (\hat{f}'\hat{f})^{-1} \hat{f} - \lambda^0 (\lambda'^0\lambda^0)^{-1} (f^0f^0)^{-1} f^0 \| = O_p \left( N^{-3/2} \right) . \]

Lemma S.10.5. Under the Assumptions of Theorem 4.4 we have

(i) \[ N^{-1} \left\| E_C(e'e_k) - (\hat{e}'X_k)^{\text{truncR}} \right\| = o_p(1) , \]

(ii) \[ N^{-1} \left\| E_C(e'e) - (\hat{e}'\hat{e})^{\text{truncD}} \right\| = o_p(1) , \]

(iii) \[ T^{-1} \left\| E_C(\hat{e}'\hat{e}) - (\hat{\hat{e}}'\hat{\hat{e}})^{\text{truncD}} \right\| = o_p(1) . \]

Lemma S.10.6. Under the Assumptions of Theorem 4.4 we have

(i) \[ N^{-1} \left\| (\hat{e}'X_k)^{\text{truncR}} \right\| = O_p(MT^{1/8}) , \]

(ii) \[ N^{-1} \left\| (\hat{e}'\hat{e})^{\text{truncD}} \right\| = O_p(1) , \]

(iii) \[ T^{-1} \left\| (\hat{\hat{e}}'\hat{\hat{e}})^{\text{truncD}} \right\| = O_p(1) . \]

The proof of the above lemmas is given section S.11 below. Using these lemmas we can now prove Theorem 4.4.

Proof of Theorem 4.4, Part I: show \( \hat{W} = W + o_p(1) \).

\(^3\)We consider a limit \( N,T \to \infty \) and for different \( N,T \) different \( H \)-matrices can be chosen, but we write \( H \) instead of \( H_{NT} \) to keep notation simple.
Using $|\text{Tr}(C)| \leq \|C\| \text{ rank}(C)$ and corollary S.10.2 we find:

\[
\left| \hat{W}_{k_1k_2} - W_{NT,k_1k_2} \right| = \left| (NT)^{-1} \text{Tr} \left[ (\hat{M}_\lambda - M_\lambda^0) X_{k_1} M_{\hat{f}} X_{k_2} \right] + (NT)^{-1} \text{Tr} \left[ M_\lambda^0 X_{k_1} (M_{\hat{f}} - M_{f_0}) X_{k_2} \right] \right|
\leq \frac{2R}{NT} \|M_\lambda - M_\lambda^0\| \|X_{k_1}\| \|X_{k_2}\| + \frac{2R}{NT} \|M_{\hat{f}} - M_{f_0}\| \|X_{k_1}\| \|X_{k_2}\|
= \frac{2R}{NT} \mathcal{O}_p(N^{-1}) \mathcal{O}_p(NT) + \frac{2R}{NT} \mathcal{O}_p(T^{-1}) \mathcal{O}_p(NT)
= o_p(1).
\]

Thus we have $\hat{W} = W_{NT} + o_p(1) = W + o_p(1)$. □

**Proof of Theorem 4.4, Part II:** show $\hat{\Omega} = \Omega + o_p(1)$.

Let $\Omega_{NT} \equiv \frac{1}{NT} \sum_{i=1}^N \sum_{t=1}^T \epsilon_{it}^2 X_{it} X_{it}'$. We have $\Omega = \Omega_{NT} + o_p(1) = \hat{\Omega} + A_1 + A_2 + o_p(1) = \hat{\Omega} + o_p(1)$, where $A_1$ and $A_2$ are defined in Lemma S.10.3, and the lemma states $A_1$ and $A_2$ are $o_p(1)$.

**Proof of Theorem 4.4, Part III:** show $\hat{B}_1 = B_1 + o_p(1)$.

Let $B_{1,k,NT} = N^{-1} \text{Tr} [P_{f_0}^\top E_C (e' X_k)]$. According to Assumption 6 we have $B_{1,k} = B_{1,k,NT} + o_p(1)$.

What is left to show is $B_{1,k,NT} = \hat{B}_{1,k} + o_p(1)$. Using $|\text{Tr}(C)| \leq \|C\| \text{ rank}(C)$ we find

\[
\left| B_{1,k,NT} - \hat{B}_1 \right| = \| E_C \left[ \frac{1}{N} \text{Tr}(P_{f_0}^\top e' X_k) \right] - \frac{1}{N} \text{Tr} \left[ P_{\hat{f}}^\top (e' X_k)^{\text{truncR}} \right] \|
\leq \frac{1}{N} \text{Tr} \left[ \left( P_{f_0}^\top - P_{\hat{f}} \right)^\top (e' X_k)^{\text{truncR}} \right]
+ \frac{1}{N} \text{Tr} \left\{ P_{f_0} \left[ E_C (e' X_k) - (e' X_k)^{\text{truncR}} \right] \right\}
\leq \frac{2R}{N} \left\| P_{f_0} - P_{\hat{f}} \right\| \left\| (e' X_k)^{\text{truncR}} \right\|
+ \frac{R}{N} \left\| P_{f_0} \right\| \left\| E_C (e' X_k) - (e' X_k)^{\text{truncR}} \right\|.
\]

We have $\|P_{f_0}\| = 1$. We now apply Lemmas S.10.5, S.10.2 and S.10.6 to find

\[
\left| B_{1,k,NT} - \hat{B}_1 \right| = N^{-1} \left( \mathcal{O}_p(N^{-1/2}) \mathcal{O}_p(MNT^{1/8}) + o_p(N) \right) = o_p(1).
\]

This is what we wanted to show. □

**Proof of Theorem 4.4, final part:** show $\hat{B}_2 = B_2 + o_p(1)$ and $\hat{B}_3 = B_3 + o_p(1)$.

Define

\[
B_{2,k,NT} = \frac{1}{T} \text{Tr} \left[ E_C (ee') M_{\lambda^0} X_k f_0^\top (f_0^\top f_0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right].
\]

36
According to Assumption 6 we have $B_{2,k} = B_{2,k,NT} + o_p(1)$. What is left to show is $B_{2,k,NT} = \hat{B}_{2,k} + o_p(1)$. We have

$$B_{2,k} - \hat{B}_{2,k} = \frac{1}{T} \text{Tr} \left[ E_C (ee') M_{0} X_k f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right] - \frac{1}{T} \text{Tr} \left[ (e e')^\text{truncD} M_{\hat{X}} X_k \hat{f} (\hat{f} \hat{f})^{-1} (\hat{\lambda} \hat{\lambda})^{-1} \hat{\lambda}' \right]$$

$$= \frac{1}{T} \text{Tr} \left[ (e e')^\text{truncD} M_{\hat{X}} X_k \left( f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 - \hat{f} (\hat{f} \hat{f})^{-1} (\hat{\lambda} \hat{\lambda})^{-1} \hat{\lambda}' \right) \right]$$

$$+ \frac{1}{T} \text{Tr} \left[ (e e')^\text{truncD} (M_{0} - M_{\hat{X}}) X_k f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right]$$

$$+ \frac{1}{T} \text{Tr} \left\{ \left[ E_C (ee') - (e e')^\text{truncD} \right] M_{0} X_k f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right\} .$$

Using $\text{Tr}(C) \leq \|C\| \text{rank}(C)$ (which is true for every square matrix $C$) we find

$$\left| B_{2,k} - \hat{B}_{2,k} \right| \leq \frac{\| \hat{e} e' \|_{\text{truncD}}}{T} \left\| X_k \right\| \left\| f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 - \hat{f} (\hat{f} \hat{f})^{-1} (\hat{\lambda} \hat{\lambda})^{-1} \hat{\lambda}' \right\|$$

$$+ \frac{\| \hat{e} e' \|_{\text{truncD}}}{T} \left\| \left| M_{0} - M_{\hat{X}} \right| \right\| \left\| X_k \right\| \left\| f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right\|$$

$$+ \frac{\| \hat{e} e' \|_{\text{truncD}}}{T} \left\{ \left[ E_C (ee') - (e e')^\text{truncD} \right] \left\| X_k \right\| \left\| f^0 (f^0 f^0)^{-1} (\lambda^0 \lambda^0)^{-1} \lambda^0 \right\| \right\} .$$

Here we used $\|M_{0}f^0\| = \|M_{\hat{f}}\| = 1$. Using $\|X_k\| = O_p(\sqrt{NT})$, and applying Lemmas S.10.2, S.10.4, S.10.5 and S.10.6, we now find

$$\left| B_{2,k} - \hat{B}_{2,k} \right| = T^{-1} \left[ O_p(T) O_p((NT)^{1/2}) O_p(N^{-3/2}) \right.$$

$$+ O_p(T) O_p((NT)^{1/2}) O_p((NT)^{1/2}) O_p((NT)^{-1/2})$$

$$+ o_p(T) O_p((NT)^{1/2}) O_p((NT)^{-1/2}) \right] = o_p(1).$$

This is what we wanted to show. The proof of $\hat{B}_{3} = B_{3} + o_p(1)$ is analogous. 

**S.11 Proof of Intermediate Lemma**

Here we provide the proof of some intermediate lemmas that were stated and used in section S.10. The following lemma gives a useful bound on the maximum of (correlated) random variables

**Lemma S.11.1.** Let $Z_i, i = 1, 2, \ldots, n$, be $n$ real valued random variables, and let $\gamma \geq 1$ and $B > 0$ be finite constants (independent of $n$). Assume $\max_i E_C |Z_i|^\gamma \leq B$, i.e., the $\gamma$’th moment of the $Z_i$ are finite and uniformly bounded. For $n \to \infty$ we then have

$$\max_i |Z_i| = O_p \left( n^{1/\gamma} \right) .$$

(S.11.1)
Proof. Using Jensen’s inequality one obtains \( \mathbb{E} \max_i |Z_i| \leq (\mathbb{E} \max_i |Z_i|^\gamma)^{1/\gamma} \leq (\mathbb{E} \sum_{i=1}^n |Z_i|^\gamma)^{1/\gamma} \leq (n \max_i \mathbb{E}|Z_i|^\gamma)^{1/\gamma} \leq n^{1/\gamma} B^{1/\gamma} \). Markov’s inequality then gives equation (S.11.1).

Lemma S.11.2. Let

\[
\begin{align*}
\bar{Z}^{(1)}_{k,t\tau} &= N^{-1/2} \sum_{i=1}^N [e_{it}X_{k,ir} - \mathbb{E}C(e_{it}X_{k,ir})], \\
\bar{Z}^{(2)}_t &= N^{-1/2} \sum_{i=1}^N [e_{it}^2 - \mathbb{E}C(e_{it}^2)], \\
\bar{Z}^{(3)}_i &= T^{-1/2} \sum_{t=1}^T [e_{it}^2 - \mathbb{E}C(e_{it}^2)].
\end{align*}
\]

Under assumption 5 we have

\[
\begin{align*}
\mathbb{E}C \left| \bar{Z}^{(1)}_{k,t\tau} \right|^4 &\leq B, \\
\mathbb{E}C \left| \bar{Z}^{(2)}_t \right|^4 &\leq B, \\
\mathbb{E}C \left| \bar{Z}^{(3)}_i \right|^4 &\leq B,
\end{align*}
\]

for some \( B > 0 \), i.e., the conditional expectations \( \bar{Z}^{(1)}_{k,t\tau} \), \( \bar{Z}^{(2)}_t \), and \( \bar{Z}^{(3)}_i \) are uniformly bounded over \( t, \tau \), or \( i \), respectively.

Proof. # We start with the proof for \( \bar{Z}^{(1)}_{k,t\tau} \). Define \( Z^{(1)}_{k,t\tau,i} = e_{it}X_{k,ir} - \mathbb{E}C(e_{it}X_{k,ir}) \). By assumption we have finite 8th moments for \( e_{it} \) and \( X_{k,ir} \) uniformly across \( k, i, t, \tau \), and thus (using Cauchy Schwarz inequality) we have finite 4th moment of \( Z^{(1)}_{k,t\tau,i} \) uniformly across \( k, i, t, \tau \).

For ease of notation we now fix \( k, t, \tau \) and write \( Z_i = Z^{(1)}_{k,t\tau,i} \). We have \( \mathbb{E}C(Z_i) = 0 \) and \( \mathbb{E}C(Z_iZ_jZ_kZ_l) = 0 \) if \( i \notin \{j, k, l\} \) (and the same holds for permutations of \( i, j, k, l \)). Using this we compute

\[
\begin{align*}
\mathbb{E}C \left( \sum_{i=1}^N Z_i \right)^4 &= \sum_{i,j,k,l=1}^N \mathbb{E}C(Z_iZ_jZ_kZ_l) \\
&= 3 \sum_{i \neq j} \mathbb{E}C(Z_i^2Z_j^2) + \sum_i \mathbb{E}C(Z_i^4) \\
&= 3 \sum_{i,j=1}^N \mathbb{E}C(Z_i^2) \mathbb{E}C(Z_j^2) + \sum_{i=1}^N \left\{ \mathbb{E}C(Z_i^4) - 3 \left[ \mathbb{E}C(Z_i^2) \right]^2 \right\},
\end{align*}
\]

Because we argued \( \mathbb{E}C(Z_i^4) \) is bounded uniformly, the last equation shows \( Z^{(1)}_{k,t\tau} = N^{-1/2} \sum_{i=1}^N Z^{(1)}_{k,t\tau,i} \) is bounded uniformly across \( k, t, \tau \). This is what we wanted to show.

# The proofs for \( \bar{Z}^{(2)}_t \) and \( \bar{Z}^{(3)}_i \) are analogous.
Lemma S.11.3. For a $T \times T$ matrix $A$ we have\footnote{For the boundaries of $\tau$ we could write $\max(1, t - M)$ instead of $t - M$, and $\min(T, t + M)$ instead of $t + M$, to guarantee $1 \leq \tau \leq T$. Since this would complicate notation, we prefer the convention $A_{ts} = 0$ for $t < 1$ or $\tau < 1$ of $t > T$ or $\tau > T$.}

$$\|A^{\text{truncR}}\| \leq M \|A^{\text{truncR}}\|_{\text{max}} \equiv M \max_{t} \max_{t < \tau \leq t + M} |A_{tr}|,$$

Proof. For the 1-norm of $A^{\text{truncR}}$ we find

$$\|A^{\text{truncR}}\|_1 = \max_{t=1}^{t+M} \sum_{\tau=t+1}^{t+M} |A_{tr}|$$

and analogously we find the same bound for the $\infty$-norm $\|A^{\text{truncR}}\|_{\infty}$. Applying part (vii) of Lemma S.4.1 we therefore also get this bound for the operator norm $\|A^{\text{truncR}}\|$. $\blacksquare$

Proof of Lemma S.10.3. \# We first show $A_1 \equiv (NT)^{-1} \sum_{i=1}^{N} \sum_{t=1}^{T} e_i^2 (X_{it} X_{it}^T - \hat{X}_{it} \hat{X}_{it}^T) = o_p(1)$. Let $B_{1,it} = X_{it} - \hat{X}_{it}$, $B_{2,it} = e_i^2 X_{it}$, and $B_{3,it} = e_i^2 \hat{X}_{it}$. Note $B_1$, $B_2$, and $B_3$ can either be viewed as $K$-vectors for each pair $(i, t)$, or equivalently as $N \times T$ matrices $B_{1,k}$, $B_{2,k}$, and $B_{3,k}$ for each $k = 1, \ldots, K$. We have $A_1 = (NT)^{-1} \sum_{i=1}^{N} \sum_{t=1}^{T} (B_{1,it} B_{2,it} + B_{3,it} B_{1,it})$, or equivalently

$$A_{1,k_1,k_2} = \frac{1}{NT} \text{Tr} \left(B_{1,k_1} B_{3,k_1} + B_{2,k_1} B_{3,k_2}^T\right).$$

Using $\|M_{\hat{\chi}} - M_{\chi_0}\| = O_p(N^{-1/2})$, $\|M_{\hat{f}} - M_{f_0}\| = O_p(N^{-1/2})$, $\|X_k\| = O_p(\sqrt{NT}) = O_p(N)$, we find for $B_{1,k} = (M_{\hat{\chi}_0} - M_{\chi_0}) X_k + M_{\hat{\chi}_0} (M_{f_0} - M_{\hat{f}})$ that $\|B_{1,k}\| = O_p(N^{1/2})$. In addition we have $\text{rank}(B_{1,k}) \leq 4R$. We also have

$$\|B_{2,k}\| \leq \|B_{2,k}\|_{\text{truncR}}^4 \leq \left(\sum_{i=1}^{N} \sum_{t=1}^{T} e_i^4 X_{k,it}^2\right)^2 \leq \left(\sum_{i=1}^{N} \sum_{t=1}^{T} e_i^8\right) \left(\sum_{i=1}^{N} \sum_{t=1}^{T} X_{k,it}^4\right) = O_p(NT) O_p(NT),$$

which implies $\|B_{2,k}\| = O_p(\sqrt{NT})$, and analogously we find $\|B_{3,k}\| = O_p(\sqrt{NT})$. Therefore

$$|A_{1,k_1,k_2}| \leq \frac{4R}{NT} (\|B_{1,k_1}\| \|B_{3,k_2}\| + \|B_{2,k_1}\| \|B_{1,k_2}\|)$$

$$= \frac{4R}{NT} \left(O_p(N^{1/2}) O_p(\sqrt{NT}) + O_p(\sqrt{NT}) O_p(N^{1/2})\right) = o_p(1).$$
This is what we wanted to show.

Finally, we want to show

\[
A_2 \equiv (NT)^{-1} \sum_{i=1}^{N} \sum_{t=1}^{T} (e_{it}^2 - \hat{e}_{it}^2) \hat{X}_{it} \hat{Y}_{it} = o_p(1).
\]

According to theorem S.9.1 we have \( e - \hat{e} = C_1 + C_2 \), where we defined \( C_1 = - \sum_{k=1}^{K} (\beta_k - \beta_0^k) X_k \), and

\[
C_2 = \sum_{k=1}^{K} \left( \beta_k - \beta_0^k \right) (P_{X_k} X_k M_{f_0} + X_k P_{f_0}) + P_{X_k} e M_{f_0} e P_{f_0} - \hat{e}_{(1)} - \hat{e}_{(\text{rem})},
\]

which satisfies \( \|C_2\| = O_p(N^{1/2}) \), and \( \text{rank}(C_2) \leq 11R \) (actually, one can easily prove \( \leq 5R \), but this does not follow from theorem S.9.1). Using this notation we have

\[
A_2 = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} (e_{it} + \hat{e}_{it}) (C_{1, it} + C_{2, it}) \hat{X}_{it} \hat{X}^\prime_{it},
\]

which can also be written as

\[
A_{2, k_1 k_2} = - \sum_{k_3=1}^{K} \left( \beta_{k_3} - \beta_{0, k_3} \right) (C_{5, k_1 k_2 k_3} + C_{6, k_1 k_2 k_3}) + \frac{1}{NT} \text{Tr} (C_{2} C_{3, k_1 k_2}) + \frac{1}{NT} \text{Tr} (C_{2} C_{4, k_1 k_2}),
\]

where we defined

\[
C_{3, k_1 k_2, it} = e_{it} \hat{X}_{k_1, it} \hat{X}_{k_2, it},
\]

\[
C_{4, k_1 k_2, it} = \hat{e}_{it} \hat{X}_{k_1, it} \hat{X}_{k_2, it},
\]

\[
C_{5, k_1 k_2 k_3} = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it} \hat{X}_{k_1, it} \hat{X}_{k_2, it} X_{k_3, it},
\]

\[
C_{6, k_1 k_2 k_3} = \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{e}_{it} \hat{X}_{k_1, it} \hat{X}_{k_2, it} X_{k_3, it}.
\]

Again, because we have uniformly bounded 8th moments for \( e_{it} \) and \( X_{k, it} \), we find

\[
\|C_{3, k_1 k_2}\|^4 \leq \|C_{3, k_1 k_2}\|^4_F
\]

\[
= \left( \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \hat{X}_{k_1, it}^2 \hat{X}_{k_2, it}^2 \right)^2
\]

\[
\leq \left( \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^4 \right) \left( \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{X}_{k_1, it}^4 \hat{X}_{k_2, it}^4 \right)
\]

\[
= O_p(N^{2T^2}),
\]

40
i.e., \( \|C_{3,k_1k_2}\| = \mathcal{O}_p(\sqrt{NT}) \). Furthermore

\[
\|C_{4,k_1k_2}\|^2 \leq \|C_{3,k_1k_2}\|_F^2 \\
= \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{e}_{it}^2 \hat{\chi}_{k_1, it}^2 \hat{\chi}_{k_2, it}^2 \\
\leq \left( \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{e}_{it}^2 \right) \max_{i=1...N} \max_{t=1...T} \left( \hat{\chi}_{k_1, it}^2 \hat{\chi}_{k_2, it}^2 \right) \\
\leq \left( \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \right) \max_{i=1...N} \max_{t=1...T} \left( \hat{\chi}_{k_1, it}^2 \hat{\chi}_{k_2, it}^2 \right) \\
= \mathcal{O}_p(NT)\mathcal{O}_p((NT)^{(4/(8+\epsilon)})) = o_p((NT)^{(3/4)}).
\]

Here we used the assumption that \( X_k \) has uniformly bounded moments of order \( 8 + \epsilon \) for some \( \epsilon > 0 \). We also used \( \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{e}_{it}^2 \leq \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \).

For \( C_5 \) we find

\[
C_{5,k_1k_2k_3}^2 = \left( \frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \right) \left( \frac{1}{NT} \hat{\chi}_{k_1, it}^2 \hat{\chi}_{k_2, it} X_{k_3, it}^2 \right) \\
= \mathcal{O}_p(1),
\]

i.e., \( C_{5,k_1k_2k_3} = \mathcal{O}_p(1) \), and analogously \( C_{6,k_1k_2k_3} = \mathcal{O}_p(1) \), because \( \sum_{i=1}^{N} \sum_{t=1}^{T} \hat{e}_{it}^2 \leq \sum_{i=1}^{N} \sum_{t=1}^{T} e_{it}^2 \).

Using these results we obtain

\[
|A_{2,k_1k_2}| \leq -\sum_{k_3=1}^{K} \left\| \beta_{k_3} - \beta_{k_3}^0 \right\| \left| C_{5,k_1k_2k_3} + C_{6,k_1k_2k_3} \right| + \frac{11R}{NT} ||C_2|| ||C_{3,k_1k_2}|| + \frac{11R}{NT} ||C_2|| ||C_{4,k_1k_2}|| \\
= \mathcal{O}_p((NT)^{-1/2})\mathcal{O}_p(1) + \frac{11R}{NT} \mathcal{O}_p(N^{1/2})\mathcal{O}_p(\sqrt{NT}) + \frac{11R}{NT} \mathcal{O}_p(N^{1/2})\mathcal{O}_p((NT)^{3/4}) = o_p(1).
\]

This is what we wanted to show. \( \blacksquare \)

Remember, the truncation Kernel \( \Gamma(.) \) is defined by \( \Gamma(x) = 1 \) for \( |x| \leq 1 \) and \( \Gamma(x) = 0 \) otherwise. Without loss of generality we assume in the following the bandwidth parameter \( M \) is a positive integer (without this assumption, one needs to replace \( M \) everywhere below by the largest integer contained in \( M \), but nothing else changes).

**Proof of Lemma S.10.4.** By Lemma S.10.2 we know asymptotically \( \hat{P} \) is close to \( P_0 \) and therefore \( \text{rank}(P_\hat{f}) = \text{rank}(P_0 P_0) = R \), i.e., \( \text{rank}(P_\hat{f} f^0) = R \) asymptotically. We can therefore write \( \hat{f} = P_\hat{f} f^0 H \), where \( H = H_{NT} \) is a non-singular \( R \times R \) matrix.
We now want to show $\|H\| = O_p(1)$ and $\|H^{-1}\| = O_p(1)$. Because of our normalization of $\hat{f}$ and $f^0$ we have $H = (\hat{f}'P\hat{f}f^0/T)^{-1} = (\hat{f}'f^0/T)^{-1}$, and therefore $\|H^{-1}\| \leq \|\hat{f}'f^0/T = O_p(1)$. We also have $\hat{f} = f^0H + (P\hat{f} - P^0)f^0H$, and thus $H = f^0H/T - f^0(P\hat{f} - P^0)f^0H/T$, i.e., $\|H\| \leq O_p(1) + \|H\|O_p(T^{-1/2})$ which shows $\|H\| = O_p(1)$. Note all the following results only require $\|H\| = O_p(1)$ and $\|H^{-1}\| = O_p(1)$, but apart from that are independent of the choice of normalization.

The advantage of expressing $\hat{f}$ in terms of $P\hat{f}$ as above is that the result $\|P\hat{f} - P^0\| = O_p(T^{-1/2})$ of Lemma S.10.2 immediately implies

$$\|\hat{f} - f^0H\| = O_p(1) .$$

The FOC wrt $\lambda$ in the minimization of the first line in equation (4) reads

$$\hat{\lambda} \hat{f}'\hat{f} = \left(Y - \sum_{k=1}^{K} \hat{\beta}_k X_k\right) \hat{f} ,$$

which yields

$$\hat{\lambda} = \left[\lambda^0 f^0 + \sum_{k=1}^{K} \left(\beta_k - \hat{\beta}_k\right) X_k\right] \hat{f}' \hat{f}^{-1}$$

$$= \lambda^0 f^0 + \sum_{k=1}^{K} \left(\beta_k - \hat{\beta}_k\right) X_k + \hat{f}' \left(\hat{f}' f^0\right)^{-1} f^0 (f^0 f^0)^{-1} (H')^{-1}$$

$$= \lambda^0 (H')^{-1} + \lambda^0 f^0 (P\hat{f} - P^0) f^0 (f^0 f^0)^{-1} (H')^{-1}$$

$$+ \lambda^0 f^0 f^0 \left(\left(f^0 f^0\right)^{-1} - (f^0 f^0)^{-1}\right) (H')^{-1}$$

$$+ \left[\sum_{k=1}^{K} \left(\beta_k - \hat{\beta}_k\right) X_k + \hat{f}' f^0 \left(f^0 f^0\right)^{-1} (H')^{-1}\right] .$$

We have $\left(f^0 f^0\right)^{-1}/T - (f^0 f^0/T)^{-1} = O_p(T^{-1/2})$, because $\|P\hat{f} - P^0\| = O_p(T^{-1/2})$ and $f^0 f^0/T$ by assumption is converging to a positive definite matrix (or given our particular choice of normalization is just the identity matrix $I_R$). In addition, we have $\|e\| = O_p(\sqrt{T})$, $\|X_k\| = O_p(\sqrt{N}T)$ and by corollary S.10.1 also $\|\beta - \beta^0\| = O_p(1/\sqrt{N}T)$. Therefore

$$\|\hat{\lambda} - \lambda^0 (H')^{-1}\| = O_p(1) ,$$

which is what we wanted to prove.
Next, we want to show
\[
\left\| \left( \frac{\hat{\lambda}' \hat{\lambda}}{N} \right)^{-1} - \left( \frac{(H)^{-1} \lambda^0 \lambda^0 (H')^{-1}}{N} \right) \right\| = O_p \left( N^{-1/2} \right),
\]
\[
\left\| \left( \frac{\hat{f}' \hat{f}}{T} \right)^{-1} - \left( \frac{(H' f^0 f^0 H)}{T} \right)^{-1} \right\| = O_p \left( T^{-1/2} \right). \quad (S.11.4)
\]

Let \( A = N^{-1} \hat{\lambda}' \hat{\lambda} \) and \( B = N^{-1} (H)^{-1} \lambda^0 \lambda^0 (H')^{-1} \). Using (S.11.3) we find
\[
\|A - B\| = \frac{1}{2N} \left\| \left[ \hat{\lambda}' + (H)^{-1} \lambda^0 \right] \left[ \hat{\lambda} - \lambda^0 (H')^{-1} \right] + \left[ \hat{\lambda}' - (H)^{-1} \lambda^0 \right] \left[ \hat{\lambda} + \lambda^0 (H')^{-1} \right] \right\|
= N^{-1} O_p(N^{1/2}) O_p(1) = O_p \left( N^{-1/2} \right).
\]

By assumption 1 we know
\[
\left\| \left( \frac{\lambda^0 \lambda^0}{N} \right)^{-1} \right\| = O_p(1),
\]
and thus also \( \|B^{-1}\| = O_p(1) \), and therefore \( \|A^{-1}\| = O_p(1) \) (using \( \|A-B\| = o_p(1) \) and applying Weyl’s inequality to the smallest eigenvalue of \( B \)). Because \( A^{-1} - B^{-1} = A^{-1}(B - A)B^{-1} \) we find
\[
\|A^{-1} - B^{-1}\| \leq \|A^{-1}\| \|B^{-1}\| \|A - B\|
= O_p \left( N^{-1/2} \right).
\]

Thus, we have shown the first statement of (S.11.4), and analogously one can show the second one. Combining (S.11.3), (S.11.2) and (S.11.4) we obtain
\[
\left\| \frac{\hat{\lambda}}{\sqrt{N}} \left( \frac{\hat{\lambda}' \hat{\lambda}}{N} \right)^{-1} \left( \frac{\hat{f}' \hat{f}}{T} \right)^{-1} \frac{\hat{f}}{\sqrt{T}} - \frac{\lambda^0 \lambda^0}{\sqrt{N}} \left( \frac{\lambda^0 \lambda^0}{N} \right)^{-1} \left( \frac{f^0 f^0}{T} \right)^{-1} \frac{f^0}{\sqrt{T}} \right\|
= \left\| \frac{\hat{\lambda}}{\sqrt{N}} \left( \frac{\hat{\lambda}' \hat{\lambda}}{N} \right)^{-1} \left( \frac{\hat{f}' \hat{f}}{T} \right)^{-1} \frac{\hat{f}}{\sqrt{T}} - \frac{\lambda^0 (H')^{-1}}{\sqrt{N}} \left( \frac{(H)^{-1} \lambda^0 \lambda^0 (H')^{-1}}{N} \right)^{-1} \left( \frac{H' f^0 f^0 H}{T} \right)^{-1} \frac{H' f^0}{\sqrt{T}} \right\|
= O_p \left( N^{-1/2} \right),
\]
which is equivalent to the statement in the lemma. Note also \( \hat{\lambda} (\hat{\lambda}' \hat{\lambda})^{-1} (\hat{f}' \hat{f})^{-1} \frac{\hat{f}}{\sqrt{T}} \) is independent of \( H \), i.e., independent of the choice of normalization. \( \blacksquare \)
Proof of Lemma S.10.5. # Part A of the proof: We start by showing

\[ N^{-1} \left\| \mathbb{E}_C \left[ e'X_k - (e'X_k)^{\text{truncR}} \right] \right\| = o_p(1) . \]  

(S.11.5)

Let \( A = e'X_k \) and \( B = A - A^{\text{truncR}} \). By definition of the left-sided truncation (using the truncation kernel \( \Gamma(.) \) defined above) we have \( B_{t\tau} = 0 \) for \( t < \tau \leq t+M \) and \( B_{t\tau} = A_{t\tau} \) otherwise. By assumption 5 we have \( \mathbb{E}_C(A_{t\tau}) = 0 \) for \( t \geq \tau \). For \( t < \tau \) we have \( \mathbb{E}_C(A_{t\tau}) = \sum_{i=1}^{N} \mathbb{E}_C(e_{it}X_{k,\tau}) \). We thus have \( \mathbb{E}_C(B_{t\tau}) = 0 \) for \( \tau \leq t+M \), and \( \mathbb{E}_C B_{t\tau} = \sum_{i=1}^{N} \mathbb{E}_C(e_{it}X_{k,\tau}) \) for \( \tau > t+M \). Therefore

\[
\| \mathbb{E}_C(B) \|_1 = \max_{t=1...T} \sum_{\tau=1}^{T} \left| \mathbb{E}_C(B_{t\tau}) \right| 
\leq \max_{t=1...T} \sum_{\tau=t+M+1}^{T} \left| \sum_{i=1}^{N} \mathbb{E}_C(e_{it}X_{k,\tau}) \right| 
\leq N \max_{t=1...T} \sum_{\tau=t+M+1}^{T} c(\tau - t)^{-(1+c)} = o_p(N) ,
\]

where we used \( M \to \infty \). Analogously we can show \( \| \mathbb{E}_C(B) \|_{\infty} = o_p(N) \). Using part (vii) of Lemma S.4.1 we therefore also find \( \| \mathbb{E}_C(B) \| = o_p(N) \), which is equivalent to equation (S.11.5) we wanted to show in this part of the proof. Analogously we can show

\[
N^{-1} \left\| \mathbb{E}_C \left[ e'e - (e'e)^{\text{truncD}} \right] \right\| = o_p(1) ,
T^{-1} \left\| \mathbb{E}_C \left[ ee' - (ee')^{\text{truncD}} \right] \right\| = o_p(1) .
\]

# Part B of the proof: Next, we want to show

\[ N^{-1} \left\| [e'X_k - \mathbb{E}_C (e'X_k)]^{\text{truncR}} \right\| = o_p(1) . \]  

(S.11.6)

Using Lemma S.11.3 we have

\[
N^{-1} \left\| [e'X_k - \mathbb{E}_C (e'X_k)]^{\text{truncR}} \right\| \leq M \max_{t} \max_{t<\tau \leq t+M} N^{-1} \left| e'X_k,\tau - \mathbb{E}_C (e'X_k,\tau) \right| 
\leq M \max_{t} \max_{t<\tau \leq t+M} N^{-1} \left| \sum_{i=1}^{N} e_{it}X_{k,\tau} - \mathbb{E}_C (e_{it}X_{k,\tau}) \right| 
\leq M N^{-1/2} \max_{t} \max_{t<\tau \leq t+M} \left| \tilde{Z}_{k,\tau}^{(1)} \right| .
\]

According to Lemma S.11.2 we know \( \mathbb{E}_C \left| \tilde{Z}_{k,\tau}^{(1)} \right|^{4} \) is bounded uniformly across \( t \) and \( \tau \). Applying Lemma S.11.1 we therefore find \( \max_{t} \max_{t<\tau \leq t+M} \tilde{Z}_{t\tau}^{(1)} = O_p((MT)^{1/4}) \). Thus we have

\[
M N^{-1/2} \max_{t} \max_{t<\tau \leq t+M} \left| \tilde{Z}_{t\tau}^{(1)} \right| = O_p \left( MN^{-1/2} (MT)^{1/4} \right) = o_p(1) .
\]
Here we used $M^5/T \to 0$. Analogously we can show
\[
N^{-1} \left\| [e'e - \mathbb{E}_C (e'e)]^{\text{truncD}} \right\| = o_p(1),
\]
\[
T^{-1} \left\| [ee' - \mathbb{E}_C (ee')]^{\text{truncD}} \right\| = o_p(1).
\]

# Part C of the proof: Finally, we want to show
\[
N^{-1} \left\| [e'X_k - \hat{e}' X_k]^{\text{truncR}} \right\| = o_p(1).
\]  
(S.11.7)

According to theorem S.9.1 we have $\hat{e} = M\lambda_0 e M_{f0} + e_{\text{rem}}$, where $e_{\text{rem}} := e_{\hat{e}}^{(1)} - \sum_{k=1}^{K} (\beta_k - \beta^0_k) \tilde{e}_k^{(1)} + C_{\text{(rem)}}$. We then have
\[
N^{-1} \left\| [e'X_k - \hat{e}' X_k]^{\text{truncR}} \right\| 
\leq N^{-1} \left\| [e'_{\text{rem}} X_k]^{\text{truncR}} \right\| + N^{-1} \left\| [P_{f0} e' M\lambda_0 X_k]^{\text{truncR}} \right\| + N^{-1} \left\| [e' P\lambda_0 X_k]^{\text{truncR}} \right\|.
\]

Using corollary S.10.1 we find the remainder term satisfies $\|e_{\text{rem}}\| = O_p(1)$. Using Lemma S.11.3 we find
\[
N^{-1} \left\| [e'_{\text{rem}} X_k]^{\text{truncR}} \right\| = \frac{M}{N} \max_{t,\tau} e'_{\text{rem},t} X_{k,\tau}
\]
\[
\leq \frac{M}{N} \max_{t,\tau} \|e_{\text{rem},t}\| \|X_{k,\tau}\|
\]
\[
\leq \frac{M}{N} \|e_{\text{rem}}\| \max_{\tau} \|X_{k,\tau}\|
\]
\[
\leq \frac{M}{N} O_p(1) O_p(N^{1/2} T^{1/8}) = o_p(1),
\]
where we used the fact that the norm of each column $e_{\text{rem},t}$ is smaller than the operator norm of the whole matrix $e_{\text{rem}}$. In addition we used Lemma S.11.1 and the fact that $N^{-1/2} \|X_{k,\tau}\| = \sqrt{N^{-1} \sum_{i=1}^{N} X_{k,i\tau}^2}$ has finite 8'th moment to show $\max_{\tau} \|X_{k,\tau}\| = O_p(N^{1/2} T^{1/8})$. Using again Lemma S.11.3 we find
\[
N^{-1} \left\| [P_{f0} e' M\lambda_0 X_k]^{\text{truncR}} \right\| \leq N^{-1} M \max_{t,\tau = 1...T} |f_t^0 (f^{0'} f^0)^{-1} f^{0'} e' M\lambda_0 X_{k,\tau}|
\]
\[
\leq N^{-1} M \|e\| \|f_t^0\| \|(f^{0'} f^0)^{-1}\| \max_{t} \|f_t^{0'}\| \max_{\tau} \|X_{k,\tau}\|
\]
\[
= N^{-1} M O_p(N^{1/2}) O_p(T^{1/2}) O_p(T^{-1}) O_p(N^{1/2} T^{1/8}) = o_p(1),
\]
and
\[
\| [e' P\lambda_0 X_k]^{\text{truncR}} \| \leq N^{-1/2} M \max_{t=1...T} \left( N^{-1/2} \sum_i e_i \lambda_i^0 \right) \left( N^{-1} \lambda^{0'} \lambda^0 \right)^{-1} \max_{\tau = 1...T} \left( N^{-1} \sum_j \lambda_j^{0'} X_{jt} \right)
\]
\[
= N^{-1/2} M O_p(T^{1/8}) O_p(1) O_p(T^{1/8}) = o_p(1).
\]
Thus, we proved equation (S.11.7). Analogously we obtain

\[ N^{-1} \left\| [e' - \hat{e}']^{\text{truncD}} \right\| = o_p(1), \]
\[ T^{-1} \left\| [ee' - \hat{e}\hat{e}']^{\text{truncD}} \right\| = o_p(1). \]

Combining (S.11.5), (S.11.6), and (S.11.7), we obtain \( N^{-1} \left\| \mathbb{E}_C(e'X_k) - (\hat{e}'X_k)^{\text{truncR}} \right\| = o_p(1) \). The proof of the other two statements of the lemma is analogous.

**Proof of Lemma S.10.6.** Using theorem S.9.1 and S.10.1 we find \( \|\hat{e}\| = O_p(N^{1/2}) \). Applying Lemma S.11.3 we therefore find

\[ N^{-1} \left\| (\hat{e}'X_k)^{\text{truncR}} \right\| \leq \frac{M}{N} \max_{t,\tau} |\hat{e}'_t X_{k,\tau}| \]
\[ \leq \frac{M}{N} \max_{t,\tau} \|\hat{e}'_t\| \|X_{k,\tau}\| \]
\[ \leq \frac{M}{N} \|\hat{e}'\| \max_{\tau} \|X_{k,\tau}\| \]
\[ \leq \frac{M}{N} O_p(N^{1/2})O_p(N^{1/2}T^{1/8}) = O_p(MT^{1/8}), \]

where we used the result \( \max_{\tau} \|X_{k,\tau}\| = O_p(N^{1/2}T^{1/8}) \) that was already obtained in the proof of the last theorem.

The proof for the statement (ii) and (iii) is analogous.

**S.12 Proofs for Section 5 (Testing)**

**Proof of Theorem 5.1.** Using the expansion for \( L_{NT}(\beta) \) in Lemma S.1 in the supplementary material of Moon and Weidner (2015) we find for the derivative (the sign convention \( \epsilon_k = \beta_0^k - \beta_k \) results in the minus sign below)

\[ \frac{\partial L_{NT}}{\partial \beta_k} = -\frac{1}{NT} \sum_{g=2}^{\infty} g \sum_{\kappa_1=0}^{K} \sum_{\kappa_2=0}^{K} \cdots \sum_{\kappa_{g-1}=0}^{K} \epsilon_{\kappa_1} \epsilon_{\kappa_2} \cdots \epsilon_{\kappa_{g-1}} L^{(g)}(\lambda^0, f^0, X_k, X_{\kappa_1}, \ldots, X_{\kappa_{g-1}}) \]
\[ = [2W_{NT}(\beta - \beta^0)]_k - \frac{2}{\sqrt{NT}} C_{NT,k} + \frac{1}{NT} \nabla R_{1,NT,k} + \frac{1}{NT} \nabla R_{2,NT,k}, \]
where
\[ W_{NT,k_1k_2} = \frac{1}{NT} L^{(2)} \left( \lambda^0, f^0, X_{k_1}, X_{k_2} \right), \]
\[ C_{NT,k} = \frac{1}{2\sqrt{NT}} \sum_{g=2}^{G_c} g (\epsilon_0)^{g-1} L^{(g)} \left( \lambda^0, f^0, X_k, X_0, \ldots, X_0 \right) \]
\[ = \sum_{g=2}^{G_c} \frac{g}{2\sqrt{NT}} L^{(g)} \left( \lambda^0, f^0, X_k, e, \ldots, e \right), \]

and
\[ \nabla R_{1,NT,k} = - \sum_{g=G_c+1}^{\infty} g (\epsilon_0)^{g-1} L^{(g)} \left( \lambda^0, f^0, X_k, X_0, \ldots, X_0 \right), \]
\[ = - \sum_{g=G_c+1}^{\infty} g L^{(g)} \left( \lambda^0, f^0, X_k, e, \ldots, e \right), \]
\[ \nabla R_{2,NT,k} = - \sum_{g=3}^{\infty} \sum_{r=1}^{g-1} \left( \frac{g-1}{r} \right) \sum_{k_1=1}^K \sum_{k_r=1}^K \epsilon_{k_1} \ldots \epsilon_{k_r} (\epsilon_0)^{g-r-1} \]
\[ \sum_{k_1=1}^K \sum_{k_r=1}^K \left( \beta^0_{k_1} - \beta_{k_1} \right) \ldots \left( \beta^0_{k_r} - \beta_{k_r} \right) \]
\[ L^{(g)} \left( \lambda^0, f^0, X_k, X_{k_1}, \ldots, X_{k_r}, X_0, \ldots, X_0 \right), \]
\[ = - \sum_{g=3}^{\infty} \sum_{r=1}^{g-1} \left( \frac{g-1}{r} \right) \sum_{k_1=1}^K \sum_{k_r=1}^K \left( \beta^0_{k_1} - \beta_{k_1} \right) \ldots \left( \beta^0_{k_r} - \beta_{k_r} \right) \]
\[ L^{(g)} \left( \lambda^0, f^0, X_k, X_{k_1}, \ldots, X_{k_r}, e, \ldots, e \right). \]
The above expressions for \( W_{NT} \) and \( C_{NT} \) are equivalent to their definitions given in theorem 4.1. Using the bound on \( L^{(q)} \) we find\(^5\)

\[
|\nabla R_{1,NT,k}| \leq c_0 \frac{NT}{\sqrt{NT}} \sum_{g=G_{e}+1}^{\infty} g^2 \left( c_1 \frac{\|e\|}{\sqrt{NT}} \right)^{g-1} \\
\leq 2c_0 (1 + G_e)^2 NT \frac{\|X_k\|}{\sqrt{NT}} \left( c_1 \frac{\|e\|}{\sqrt{NT}} \right)^{G_e} \left[ 1 - \left( c_1 \frac{\|e\|}{\sqrt{NT}} \right) \right]^{-3} = o_p(\sqrt{NT}) ,
\]

\[
|\nabla R_{2,NT,k}| \leq c_0 NT \frac{\|X_k\|}{\sqrt{NT}} \sum_{g=3}^{\infty} g^2 \sum_{r=1}^{g-1} \left( g - 1 \right) c_1^{g-1} \left( \sum_{k=1}^{K} |\beta_k - \beta^0_k| \frac{\|X_k\|}{\sqrt{NT}} \right) \\
\times \left( \sum_{k=1}^{K} |\beta_k - \beta^0_k| \frac{\|X_k\|}{\sqrt{NT}} + \frac{\|e\|}{\sqrt{NT}} \right)^{g-2} \\
\leq c_2 NT \frac{\|X_k\|}{\sqrt{NT}} \left( \sum_{k=1}^{K} |\beta_k - \beta^0_k| \frac{\|X_k\|}{\sqrt{NT}} \right) \left( \sum_{k=1}^{K} |\beta_k - \beta^0_k| \frac{\|X_k\|}{\sqrt{NT}} + \frac{\|e\|}{\sqrt{NT}} \right)^{g-2} ,
\]

where \( c_0 = 8Rd_{\max}(\lambda^0, f^0)/2 \) and \( c_1 = 16d_{\max}(\lambda^0, f^0)/d_{\min}(\lambda^0, f^0) \) both converge to a constants as \( N, T \to \infty \), and the very last inequality is only true if \( 4c_1 \left( \sum_{k=1}^{K} |\beta_k - \beta^0_k| \frac{\|X_k\|}{\sqrt{NT}} + \frac{\|e\|}{\sqrt{NT}} \right) < 1 \), and \( c_2 > 0 \) is an appropriate positive constant. To show \( \nabla R_{1,NT,k} = o_p(NT) \) we used Assumption 3*. From the above inequalities we find for \( \eta_{NT} \to \infty \)

\[
\sup_{\{\beta: \|\beta - \beta^0\| \leq \eta_{NT}\}} \frac{\|\nabla R_{1,NT}(\beta)\|}{\sqrt{NT}} = o_p(1) ,
\]

\[
\sup_{\{\beta: \|\beta - \beta^0\| \leq \eta_{NT}\}} \frac{\|\nabla R_{2,NT}(\beta)\|}{NT \|\beta - \beta^0\|} = o_p(1) .
\]

Thus \( R_{NT}(\beta) = R_{1,NT}(\beta) + R_{2,NT}(\beta) \) satisfies the bound in the theorem. \( \blacksquare \)

**Proof of Theorem 5.2.** Using Theorem 4.3 it is straightforward to show \( WD_{NT}^* \) has limiting distribution \( \chi^2 \).

For the LR test we have to show the estimator \( \hat{c} = (NT)^{-1} \text{Tr}(\hat{e}(\hat{\beta}) \hat{e}'(\hat{\beta})) \) is consistent for \( c = \mathbb{E} c e_i^2 \). As already noted in the main text we have \( \hat{c} = L_{NT} \left( \hat{\beta} \right) \), and using our expansion and \( \sqrt{NT} \)-consistency of \( \hat{\beta} \) we immediately obtain

\[
\hat{c} = \frac{1}{NT} \text{Tr}(M_{\lambda^0} e M_{\rho^0} e') + o_p(1) .
\]

\(^5\)Here we use \( \binom{n}{k} \leq 4^n \).
Alternatively, one could use the expansion of $\hat{e}$ in Theorem S.9.1 to show this. From the above result we find

$$\left| \hat{c} - \frac{1}{NT} \text{Tr}(ee') \right| = \frac{1}{NT} \left| \text{Tr}(P_{\lambda^0} e M_{\rho^0} e') + \text{Tr}(eP_{\rho^0} e') \right| + o_p(1)$$

$$\leq \frac{2R}{NT} \|e\|^2 + o_p(1) = o_p(1).$$

By the weak law of large numbers we thus have

$$\hat{c} = \frac{1}{NT} \sum_{i=1}^N \sum_{t=1}^T e_{it}^2 + o_p(1) = c + o_p(1),$$

i.e., $\hat{c}$ is indeed consistent for $c$. Having this one immediately obtains the result for the limiting distribution of $LR_{NT}^*.$

For the LM test we first want to show equation (9) holds. Using the expansion of $\hat{e}$ in Theorem S.9.1 one obtains

$$\sqrt{NT}(\widetilde{\nabla}L_{NT})_k = -\frac{2}{\sqrt{NT}} \text{Tr}(X_k e)$$

$$= \left[ 2 \sqrt{NT} W_{NT} \left( \widetilde{\beta} - \beta^0 \right) \right]_k + \frac{2}{NT} C^{(1)}(\lambda^0, f^0, X_k, e) + \frac{2}{NT} C^{(2)}(\lambda^0, f^0, X_k, e)$$

$$- \frac{2}{\sqrt{NT}} \text{Tr}(X_k' \tilde{e}^{(\text{rem})})$$

$$= \left[ 2 \sqrt{NT} W_{NT} \left( \widetilde{\beta} - \beta^0 \right) + \frac{2}{NT} C_{NT} \right]_k + o_p(1)$$

$$= \sqrt{NT} \left[ \nabla L_{NT}(\tilde{\beta}) \right]_k + o_p(1),$$

which is what we wanted to show. Here we used $|\text{Tr}(X_k' \tilde{e}^{(\text{rem})})| \leq 7R\|X_k\|\|\tilde{e}^{(\text{rem})}\| = O_p(N^{3/2}).$ Note that $\|X_k\| = O_p(N)$, and Theorem S.9.1, and $\sqrt{NT}$-consistency of $\tilde{\beta}$, together imply $\|\tilde{e}^{(\text{rem})}\| = O_p(\sqrt{N}).$ We also used the expression for $\nabla L_{NT}(\tilde{\beta})$ given in Theorem 5.1, and the bound on $\nabla R_{NT}(\beta)$ given there.

We now use equation (10) and $\widetilde{\nabla} = W + o_p(1), \widetilde{\Omega} = \Omega + o_p(1),$ and $\widetilde{B} = B + o_p(1)$ to obtain

$$LM_{NT}^* \xrightarrow{d} (C - B)' W^{-1} H'(HW^{-1} \Omega W^{-1} H')^{-1} HW^{-1} (C - B).$$

Under $H_0$ we thus find $LM_{NT}^* \xrightarrow{d} \chi^2_r.$

### S.13 Additional Monte Carlo Results

We consider an AR(1) model with $R$ factors

$$Y_{it} = \rho^0 Y_{i,t-1} + \sum_{r=1}^R \lambda^0_r f_{tr} + e_{it}.$$
We draw the $e_{it}$ independently and identically distributed from a $t$-distribution with five degrees of freedom. The $\lambda^0_{ir}$ are independently distributed as $N(1, 1)$, and we generate the factors from an AR(1) specification, namely $f^0_{tr} = \rho_f f^0_{t-1,r} + u_{tr}$, for each $r = 1, \ldots, R$, where $u_{tr} \sim \text{iid} N(0, (1 - \rho_f^2)\sigma_f^2)$. For all simulations we generate 1,000 initial time periods for $f^0_t$ and $Y_{it}$ that are not used for estimation. This guarantees the simulated data used for estimation are distributed according to the stationary distribution of the model.

For $R = 1$ this is exactly the simulation design used in the main text Monte Carlo section, but DGPs with $R > 1$ were not considered in the main text. Table S.1 reports results for which $R = 1$ is used both in the DGP and for the LS estimation. Table S.2 reports results for which $R = 1$ is used in the DGP, but $R = 2$ is used for the LS estimation. Table S.3 reports results for which $R = 2$ is used both in the DGP and for the LS estimation. The results in Table S.1 and S.2 are identical to those reported in the main text Table 1 and 2, except we also report results for the CCE estimator. The results in Table S.3 are not contained in the main text.

The CCE estimator is obtained by using $\hat{f}^\text{proxy}_t = N^{-1} \sum_i (Y_{it}, Y_{i,t-1})'$ as a proxy for the factors and then estimating the parameters $\rho$, $\lambda_1$, $\lambda_2$, $i = 1, \ldots, N$, via OLS in the linear regression model $Y_{it} = \rho Y_{i,t-1} + \lambda_1 \hat{f}^\text{proxy}_{1,t} + \lambda_2 \hat{f}^\text{proxy}_{2,t} + e_{it}$.

The performance of the CCE estimator in Table S.1 and S.2 are identical (up to random MC noise), because the number of factors need not be specified for the CCE estimator, and the DGPs in Table S.1 and S.2 are identical. These tables show for $R = 1$ in the DGP, the CCE estimator performs very well. From Chudik and Pesaran (2015) we expect the CCE estimator to have a bias of order $1/T$ in a dynamic model, which is confirmed in the simulations: the bias of the CCE estimator shrinks roughly in inverse proportion to $T$, as $T$ becomes larger. The $1/T$ bias of the CCE estimator could be corrected for, and we would expect the bias-corrected CCE estimator to perform similarly to the bias-corrected LS estimator.

However, if there are $R = 2$ factors in the true DGP, then it turns out the proxies $\hat{f}^\text{proxy}_t$ do not pick those up correctly. Table S.3 shows for some parameter values and sample sizes (e.g., $\rho^0 = 0.3$ and $T = 10$, or $\rho^0 = 0.9$ and $T = 40$) the CCE estimator is almost unbiased, but for other values, including $T = 80$, the CCE estimator is heavily biased if $R = 2$. In particular, the bias of the CCE estimator does not seem to converge to zero as $T$ becomes large in this case. By contrast, the correctly specified LS estimators (i.e., correctly using $R = 2$ factors in the estimation) performs very well according to Table S.3. However, an incorrectly specified LS estimator, which would underestimate the number of factors (e.g., using $R = 1$ factors in estimation instead of the correct number $R = 2$) would probably perform similarly to the CCE estimator, because not all factors would be corrected for. Overestimating the number of factors.
(i.e., using $R = 3$ factors in estimation instead of the correct number $R = 2$) should, however, not pose a problem for the LS estimator, according to Moon and Weidner (2015).
