

sFigure 1. Change in Neuropsychological Performance Among Patients With Schizophrenia and Other Psychoses in Relation to Change in Symptom Severity^a.

^a - Presented are effect sizes and 95% Confidence Intervals of difference in change from baseline to follow up between the diagnostic group and comparison group as a function of change in symptom severity. 95% Confidence Intervals that do not include zero indicate statistical significance level $p < 0.05$. Effect sizes are adjusted for age, sex, ethnicity, level of education, time from baseline assessment and baseline test score. Trailmaking A=Trail Making Test, Part A; Trailmaking B=Trail Making Test, Part B.
