

Table 1. What drugs do people have sex on? (SLS drug use). In the last 12 months, which of the following drugs have you had sex on? Number (percentage) [percentage rank]. The percentage has been calculated by dividing the number of 'yes I have had sex on this drug in the last 12 months' answers by total number of that group and multiplying by 100. Chi-square tests and p-values are shown for the overall difference between men and women reporting sex on each drug, and the differences between the sexual orientations within each gender separately. The chi-square tests were not conducted for women when fewer than five respondents in a group reported taking the drug during sex.
