## Figure legends

**Figure SA1:** Kaplan-Meier curve comparing OS in patients (ITT cohort) with FLC ratio < 100 at diagnosis based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly better survival than those without any subsequent therapy after 1<sup>st</sup> line- median OS 74 months (95% CI 58.40-89.59 months) vs. 49 months (95% CI 36.91-61.09 months) ( $p < 0.005$ ).

**Figure SA2:** Kaplan-Meier curve comparing OS in patients (ITT cohort) with FLC ratio  $\geq 100$  at diagnosis based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly better survival than those without any subsequent therapy after 1<sup>st</sup> line- median OS not reached vs. 8 months (95% CI 36.91-61.09 months) ( $p < 0.005$ ).

**Figure SA3:** Kaplan-Meier curve comparing OS in patients (12-month landmark cohort) with FLC ratio < 100 at diagnosis based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between patients with > 1 line of treatment and those without any subsequent therapy after 1<sup>st</sup> line- median OS 80 months (95% CI 66.95-93.04 months) vs. 89 months ( $p = 0.070$ ).

**Figure SA4:** Kaplan-Meier curve comparing OS in patients (12-month landmark cohort) with FLC ratio > 100 at diagnosis based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between patients with > 1 line of treatment and those without any subsequent therapy after 1<sup>st</sup> line- median OS not reached in both groups ( $p = 0.638$ ).

**Figure SA5:** Kaplan-Meier curve comparing OS in Mayo stage I patients (ITT cohort) based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between patients with > 1 line of treatment and those without any subsequent therapy after 1<sup>st</sup> line- median OS 87 months vs not reached ( $p = 0.089$ ).

**Figure SA6:** Kaplan-Meier curve comparing OS in Mayo stage II patients (ITT cohort) based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly better survival compared to patients without subsequent therapy after 1<sup>st</sup> line- median OS not reached vs 80 months (95% CI 66.14-93.86 months) ( $p = 0.043$ ).

**Figure SA7:** Kaplan-Meier curve comparing OS in Mayo stage III patients (ITT cohort) based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly better survival compared to patients without subsequent therapy after 1<sup>st</sup> line- median OS 58 months (95% CI 48.19-67.80 months) vs 26 months (95% CI 19.03-32.96 months) ( $p < 0.005$ ).

**Figure SA8:** Kaplan-Meier curve comparing OS in Mayo stage IIIb patients (ITT cohort) based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly better survival compared to patients without subsequent therapy after 1<sup>st</sup> line- median OS not reached vs 4 months (95% CI 2.85-5.14 months) ( $p < 0.005$ ).

**Figure SA9:** Kaplan-Meier curve comparing OS in Mayo stage I patients (12-month landmark cohort) based on lines of treatments (> 1 line vs only 1 line). Patients with > 1 line of treatment had a significantly poorer survival compared to patients without subsequent therapy after 1<sup>st</sup> line- median OS 87 months vs not reached ( $p = 0.001$ ).

**Figure SA10:** Kaplan-Meier curve comparing OS in Mayo stage II patients (12-month landmark cohort) based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between the two groups- median OS 109 months (95% CI 61.48-156.52 months) vs not reached ( $p = 0.158$ ).

**Figure SA11:** Kaplan-Meier curve comparing OS in Mayo stage III patients (12-month landmark cohort) based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between the two groups- median OS 61 months vs 60 months (95% CI 50.16-69.84 months) ( $p = 0.534$ ).

**Figure SA12:** Kaplan-Meier curve comparing OS in Mayo stage IIIb patients (12-month landmark cohort) based on lines of treatments (> 1 line vs only 1 line). There was no significant difference in survival between the two groups- median OS not reached vs 71 months (95% CI 45.26-96.73 months) ( $p = 0.795$ ).

**Figure SA13:** Kaplan-Meier curve showing the impact of haematologic response after 3<sup>rd</sup> line on OS after 3<sup>rd</sup> line treatment. Patients with CR or VGPR had a significantly better survival than those with a PR or NR- median OS not reached / non reached vs. 31 months (95% CI 15.52-46.47 months) / 19 months (95% CI 16.85-21.14 months) ( $p < 0.005$ ). There was no difference in survival between CR and VGPR ( $p = 0.596$ ).

**Figure SA14:** Kaplan-Meier curve showing the impact of haematologic response after 3<sup>rd</sup> line on TNT after 3<sup>rd</sup> line treatment. Patients with CR or VGPR after 3<sup>rd</sup> line had a significantly longer TNT than those with PR/NR- median TNT 32 months (24.46-39.53) / 44 months vs. 36 months / 13 months (95% CI 5.11-20.88 months) ( $p=0.008$ ). There was no difference in TNT between CR and VGPR ( $p = 0.436$ ).

Figure SA1

Overall Survival in patients with FLC ratio < 100: > 1 line vs only 1 line (ITT cohort)

Figure SA2

Overall Survival in patients with FLC ratio > 100: > 1 line vs only 1 line (ITT cohort)

Figure SA3

Overall Survival in patients with FLC ratio < 100: > 1 line vs only 1 line (12-month cohort)

Figure SA4

Overall Survival in patients with FLC ratio > 100: > 1 line vs only 1 line (12 -months landmark cohort)

Figure SA5

ITT cohort, Mayo stage I: > 1 line vs only 1 line
