# Studies Towards the Synthesis of the Core of Sarains A, B \& C 

A thesis presented to University College London in partial fulfilment of the requirements for the degree of Doctor of Philosophy

## Pui Shan Pang

Department of Chemistry
University College London 2008

I, Pui Shan Pang, confirm that the work presented in this thesis is my own. Where information has been derived from other sources, I confirm that this has been indicated in the thesis.

#### Abstract

Sarains A-C are alkaloids isolated from the Mediterranean sponge Reniera sarai, which possess moderate antibacterial, insecticidal and antitumour properties. These alkaloids are popular targets for total synthesis, thanks to their rather unusual and challenging structure, which consists of a central diazatricyclic cage attached to two peripheral macrocycles. Arguably the most challenging aspect of their synthesis is that of the tricyclic core, and our approach involves a novel rearrangement of a simpler bicyclic aminal system. This thesis describes various attempts to synthesise cis-fused octahydropyrrolo[2,3-b]pyrrole ring systems that bear an endo acetaldehyde-derived substituent in the 3-position.

The research into the synthesis of this ring system began with enantioselective approaches, utilising asymmetric Diels-Alder reactions to establish the stereochemistry required for subsequent transformations into the bicyclic aminal. Progress from these reactions was troublesome.

In racemic approaches, the use of a Michael reaction was unsuccessful, but successful installation of the required stereochemistry was achieved by use of a thio-Claisen rearrangement. Using this method, the aforementioned functionalised acetaldehyde was produced in good yield in ten steps from simple starting materials. This provided a branching point for the exploration of four different, but related routes to the sarain core involving the generation of diazoketones, a bromoketone and hydroxy-aldehydes. Substrates to test our proposed rearrangement reaction were synthesised, but transformations into the sarain core proved unfruitful. However, a different tricyclic compound has been produced from a hydroxy-aldehyde approach.

In a separate investigation instigated by a result from previous research into synthesis of the sarain core, it was found that treatment of tertiary formamides with a silylated diazoester in the presence of rhodium acetate leads to formation of 3-amino-2silyloxyacrylates in good yields. The scope and limitations of this novel reaction were investigated.

## ACKNOWLEDGEMENTS

First and foremost I would like to express my sincere gratitude to Mike Porter. Thank you for providing me with such a challenging project, which has helped to open many doors for me. The success that I had was only possible through your support, patience, endless guidance and the enthusiasm you show in my work. What you have given goes far beyond the call of duties of a supervisor and I really could not have asked for a better one - thanks for being a great academic father!

The three years of my PhD would not have been the same without the people within the group either: thanks to Salma and Nicki for showing me the ropes, and Sarah and Vincent the ferret for your wisdom and participation in the language learning centre. Julien - thanks for the many laughs you have given me, from your love of singing to the clothing malfunction that I will always recall as one of the funniest moments of my PhD . Then there's Amandeep - how am I going to remember all those dates without you? We have many good memories, and I'm thankful to you for sharing the pain of all those "but I'm miserable now" moments together. Adam and Moussa are quite the double act that I too have to thank: Adam for sharing the love of dodgy soaps and for your inspiring "what would you rather..." questions, and Moussa for your frankly hilarious moo-isms. Last but not least, to Anne for starting the thio-Claisen route in the sarain project, but mostly for your ever generous and giving attitude, both in and outside the lab. Your arrival to the group has not only saved us from Mike in the problem sessions, but has also helped to shape the chemist that I am, and for that I am truly grateful.

There are also many people within the UCL Chemistry department that I have to thank: a big thanks to Dr Abil Aliev for your support and patience in NMR training and also for your help with structure elucidations. I would also like to thank the Caddick group for generous use of their microwave and sonicator, to Dr Lisa Harris for assistance with mass spectrometry work and to Dave Knapp for technical support. I also thank Prof. Mike Ewing for his support and encouragement to study for a PhD, and to the UCL Graduate School for providing me with a Research Scholarship.

Finally, I have to thank my family and friends for their love and support throughout my education. Thank you for keeping me sane and for helping me through thick and thin this thesis would never have been completed without your encouragement and understanding over the last few months, and for that, I am eternally grateful.

## 1. INTRODUCTION

The ocean is home to many organisms that produce a diverse range of natural products, which can be very different to those found in land-based life. Many of these natural products are structurally novel, and possess biological activities that may be useful in the treatment of diverse diseases. Thus the marine environment has attracted great interest from synthetic chemists and biologists alike.

In 1986, a fascinating group of such structurally unusual alkaloids were found in extracts from the Mediterranean sponge Reniera sarai by Cimino and co-workers. ${ }^{1}$ The main metabolites were classified into two groups, each containing alkaloids with distinct polycyclic skeletons. Sarains 1-3 consist of a trans-fused quinolizidone system linked to an unsaturated piperidine ring, both directly and by two hydrocarbon chains (Figure 1). Some minor co-occurring alkaloids, isosarains 1-3, were also isolated, which are stereoisomers of sarains 1-3, with inverted stereocentres at C1, C2 and C9. ${ }^{1-4}$

Sarain 1

Sarain 2

Sarain 3

Figure 1: Sarains 1-3

The second major group of metabolites isolated from the sponge is sarains A-C ${ }^{5,6}(\mathbf{1 - 3}$, Figure 2). Their unusual and challenging structure was elucidated by a combination of spectral studies and an X-ray crystal structure determination of the sarain A diacetate derivative 4. ${ }^{5}$ They were found to share a fused central core containing a diazatricycloundecane cage flanked by two peripheral macrocycles, the eastern of which is a 14 -membered ring containing a vicinal diol and a skipped triene (with two cis and one trans double bond). With the structure of sarain A elucidated, the structures of sarains B and C were deciphered on the basis of extensive NMR studies. The three sarains were found to differ in the size and level of unsaturation of the western macrocycle; sarains A, B and C contain a 13-, 14- or 15-membered ring respectively, and there is an extra double bond in sarains B and C. ${ }^{6}$

1: Sarain A

2: Sarain B $(\mathrm{n}=1)$
3: Sarain C $(n=2)$

4
Figure 2: Sarains A-C and diacetate derivative 4

Another intriguing structural feature of sarains A-C is their zwitterionic property, whereby in the common tricyclic core there is a strong 'proximity interaction' between the tertiary amine at N 1 and the carbonyl at C 2 (Figure 3). This was found to be sensitive to pH and solvent environment, as treatment with acid causes the characteristic aldehyde peaks in NMR and IR spectra to disappear. ${ }^{5-7}$ In addition, by running the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR in the presence of $\mathrm{CD}_{3}$ COOD, signals were observed at $\delta 5.25$ and $\delta 97.1$ respectively. These were assigned to the methine moiety between the quaternary nitrogen atom and the hydroxy group, shown in bold.

Figure 3: Proximity interaction displayed by sarains A-C

### 1.1. Properties of the sarains

The sarains were found to strongly retain inorganic salts, giving them catalytic properties comparable to those of crown ethers. ${ }^{1}$ They are able to dissolve compounds such as potassium acetate in organic solvents, enhancing the nucleophilic properties of the anion. ${ }^{1}$ With regard to biological properties, the absence of epibionts on the surface of the sponge suggested that sarains display a protective role against these fouling
organisms. Preliminary screenings on the biological activities of sarains demonstrated moderate antibacterial, insecticidal and antitumour properties. ${ }^{8}$ Sarains 1-3 were generally more active than sarains A-C when studied individually, but both were less active than the crude extract from the sponge. This increased activity may either be due to a synergistic effect of the sarains, or due to strong activity from minor co-occurring metabolites. It should be noted however, that the activity of sarains A-C could be influenced by pH , as the tricyclic core can adopt two conformations (see Figure 3).

### 1.2. Proposed biosynthetic pathway

Despite the obvious differences in structural skeleton, the sarains are believed to have the same biogenetic origin as some other alkaloids including keramaphidin B and the manzamines (Figure 4). ${ }^{9,10}$ These products are thought to arise from intramolecular cyclisations of bis(dihydropyridine) macrocylic intermediates, which are derived from condensation of acrolein and long chain aminoaldehydes. ${ }^{9}$

1: Sarain A

Keramaphidin B

Manzamine A

Figure 4

A proposed mechanism for the cyclisation of these species to form sarains A-C was put forward by Marazano (Scheme 1). ${ }^{11}$ A protonation of enamine 5 to iminium species $\mathbf{6}$, followed by an intramolecular cyclisation leads to 7. Subsequent reduction of the $\alpha, \beta$ unsaturated iminium ion affords $\mathbf{8}$, and its reaction with an electrophile, such as $\mathrm{Br}^{+}$
provides 9. A further cyclisation generates tricyclic iminium species $\mathbf{1 0}$, which is trapped with water to give hemiaminal 11, and a final cyclisation completes the biosynthesis of sarains A-C, with tetracycle $\mathbf{1 2}$ displaying the proximity interactions shown in Figure 3.

Scheme 1: Biosynthesis of sarain core
Sarains A-C and sarains 1-3 are derived from the same sponge but the two groups of alkaloids have completely different skeletons. Cimino has noted that the skeletons of sarain A (13) and that of sarain 2 (15) show a common 10 -membered alkyl chain skeleton, as highlighted in Figure 5. ${ }^{7}$ Based on these similarities, he suggested a related biogenetic origin, as bond disconnection of the two sarains leads to piperidine derivatives 14 and 16. It can be envisaged that coupling of the same precursor (the highlighted region) with a 3 -alkyl piperidine containing 10 and 12 carbons in the alkyl chain would lead to sarain A and sarain 2 respectively.

13

14

Figure 5

A second biosynthetic pathway that does not involve the formation of bis(dihydropyridines) has also been proposed by Marazano (Scheme 2). ${ }^{12}$ A retroMannich disconnection leads to iminium ion 17, which could result from condensation of the corresponding amino-aldehyde 18. This in turn can be derived from a reductive amination, with reduction of the carboxylic acid and of two double bonds in 19.

Scheme 2: Alternative biosynthesis of sarain $A$

It is anticipated that intermediate 19 is the result of multiple condensations between amino-aldehyde 20, two malondialdehyde units and macrocycle 21, which results from an intramolecular reductive amination of sphingolipid derivative 22. Thus it is proposed that the biosynthesis of sarain A is closely related to the polyketide pathway, and includes intermediates which may be derived from secondary metabolites of the spingolipid family.

### 1.3. Synthetic background

Although sarains A-C display some biological activity, what interests most chemists in this fascinating class of compounds are their rather unusual structure, which have attracted a number of groups to embark on the challenge of its synthesis. Arguably the most difficult component of the synthesis is that of the tricyclic core; this has been accomplished by five groups, with the first by Weinreb in 1991. ${ }^{13}$ A review of the various successful approaches is described, starting from the route by Overman, ${ }^{14}$ who was the first to complete the total synthesis of sarain A in 2006.

### 1.3.1. Overman's total synthesis of sarain $A$

In 1998, Overman reported the first asymmetric route to the sarain core, ${ }^{15}$ beginning the synthesis by converting L-diethyl tartrate to oxazoline 23 in 5 steps (Scheme 3). A key intermolecular Michael reaction under optimised conditions provided oxazoline 24 in good diastereoselectivity, and subsequent $N$-Boc deprotection, cyclisation and alkylation afforded lactam 25, which translactamised to pyrrolidinone 26 upon cleavage of the oxazoline ring. Elaboration to lactone 27 was followed by partial reduction and deprotonation to give tetracycle 28.

Scheme 3: Synthesis of oxazolidinone 28

To complete the synthesis of the sarain core, olefin $\mathbf{2 8}$ was converted to silyl enol ether 29, which upon treatment with $\mathrm{BBr}_{3}$, underwent an intramolecular enoxysilane- N sulfonyliminium ion cyclisation to furnish the diazatricycloundecanes $\mathbf{3 0}$ and $\mathbf{3 1}$ (desired diastereoisomer) in a 3:1 ratio.

Scheme 4: Completion of Overman's first generation synthesis of the sarain core
Overman has since improved the diastereoselectivity of the final cyclisation. ${ }^{16}$ It was postulated that replacing the methyl group with a larger side chain at the alkene would not only provide a handle to synthesise the western macrocycle, but would also serve to sterically promote cyclisation to the desired diastereoisomer (Scheme 5). In addition, he postulated that it is likely that the cyclisation mechanism proceeded through the $(E)$ OTIPS enol ether rather than a boron enolate or enol. ${ }^{16}$ Thus optimised reaction conditions that converted $\mathbf{3 2}$ into sarain core derivative $\mathbf{3 3}$ in excellent yield and diastereoselectivity involved the use of a pyridine buffer to prevent premature $\mathrm{O}-\mathrm{Si}$
bond cleavage, and at higher temperatures to promote double bond isomerisation to the $E$-alkene.

Scheme 5: Towards the synthesis of western macrocycle

After several protecting group manipulations, including removal of the $N$-tosyl group, the newly liberated amine was treated with 6 -hepten- 1 -al, and a subsequent ring-closing metathesis then provided unsaturated macrocycle 34 in $75-85 \%$ yield. ${ }^{14,16,17}$

The final macrocycle was installed by an intramolecular Stille coupling of stannane iodide 35. Subsequent reduction of the hemiaminal moiety to 36, followed by a buffered oxidation of the resulting primary alcohol, and removal of both protecting groups completed the total synthesis of ( - )-sarain A.

Scheme 6: Completion of total synthesis of (-)-sarain A

### 1.3.2. Weinreb's progress towards the synthesis of sarain $A$

Weinreb's first publication of a strategy to the sarain core was made in 1991. ${ }^{13}$ Since then, the sequence of steps has been refined, with functional handles provided in his target molecule for the attachment of the two macrocycles (Scheme 7). ${ }^{18-20}$ The key strategic steps include the stereospecific [3+2]-azomethine ylide/olefin cycloaddition that, via dipolar intermediate 37, forms the bicyclic system in 38. Subsequent protecting group manipulations and functionalisation at C 3 ' provided alcohol 39. This was converted to a mixture of acetates $\mathbf{4 0}$ which was treated with the Fleming silyl cuprate reagent to give allyl silane $\mathbf{4 1}$ as a mixture of geometric isomers. The sulfonamide lactam was then partially reduced and the resulting hemiaminal underwent an allylsilane/ $N$-sulfonyliminium ion cyclisation upon treatment with $\mathrm{FeCl}_{3}$ to give core fragment $\mathbf{4 2}$ as a mixture of epimers.

Scheme 7: Weinreb's latest synthesis of sarain core

Weinreb's strategy towards the installation of the western macrocycle began by conversion of olefin $\mathbf{4 2}$ to nitrile $\mathbf{4 3}$ in five steps. ${ }^{20}$ The formation of epimers in the final stage of the core assembly had no overall significance to the total synthesis, as deprotonation of nitrile $\mathbf{4 3}$ led to an anion which underwent a stereoselective alkylation
with the mesylate of 4-penten-1-ol, from the least hindered equatorial direction. Reductions followed by protecting group manipulations, and acylation at the piperidine nitrogen provided the second handle for a ring closing metathesis to form macrocycle 44 (Scheme 8).

Scheme 8: Weinreb's progress towards total synthesis of sarain A

After reduction of the newly formed olefin in 44, the silyl ether was cleaved and the resulting alcohol oxidised to the aldehyde. A stereoselective chelation controlled addition of ethynylmagnesium bromide to the aldehyde then produced oxazolidinone 45, thereby establishing the remaining stereocentre en route to the eastern macrocycle. Under mildly basic conditions, this oxazolidinone rearranged to cyclic carbonate 46, simultaneously protecting the diol and freeing the nitrogen for further investigations into completing the eastern ring, and ultimately the total synthesis. ${ }^{20}$

### 1.3.3. Heathcock's progress towards the synthesis of sarain $A$

Like Weinreb, Heathcock's approach to the sarain core involved an intramolecular azomethine ylide cyclisation. In this route, the azomethine ylide was originally generated by flash vacuum pyrolysis of an aziridine activated by ester and amide carbonyl groups. ${ }^{21-23}$ Limitations in the scale-up capabilities of that route led to pursuance of an alternative, and the azomethine ylide was eventually generated by condensation of amine 47 with paraformaldehyde, forming bicycle 48 in good yields (Scheme 9). ${ }^{24}$

Scheme 9: Heathcock's synthesis of sarain core

Further functionalisation of bicycle 48, including extensive protecting group manipulations afforded ester 49, which underwent isomerisation via a base promoted Dieckmann reaction to give a $\beta$-keto ester that was reduced to alcohol 50. Exposure of the derived trifluoroacetate to DBU produced a mixture of unreacted starting material, $\alpha, \beta$-unsaturated ester $\mathbf{5 1}$ in $33 \%$ yield, and the desired tricyclic nucleus $\mathbf{5 2}$ in $31 \%$ yield. Finally, removal of the nosyl group from a mixture of the latter two compounds released the amines, thus promoting 1,4-addition in the uncyclised material, and furnished the sarain core derivative 53 in $48 \%$ yield.

While other synthetic groups were focusing their attention on the synthesis of the western macrocycle, Heathcock was the first to synthesise a model of the eastern macrocycle (Scheme 10). ${ }^{23}$ The two stereocentres in the model system were installed early, achieved by a catalytic dihydroxylation to give diol 54. Elaboration to ( $E$ )-vinyl iodide 55 and acylation with acid chloride 56 gave amide 57. A palladium catalysed cyclisation gave yne-diene 58, which was subjected to hydrozirconation followed by hydrolysis of the vinylzirconium intermediate with silica gel to complete the synthesis of the triene unit within 59.

Scheme 10: Heathcock's synthesis of a model eastern macrocycle

### 1.3.4. Cha's progress towards the synthesis of sarain $A$

Cha's synthesis of the sarain core is the shortest to date, employing a [4+3]cycloaddition between a 3 -oxidopyridinium betaine and cyclopentadiene (Scheme 11). Complications involving the use of 5-nitro-2-pyridine-substituted compounds in the initial route ${ }^{25}$ led to a second generation synthesis using an $E-\beta$-(4'-fluorobenzoyl)vinyl derivative in $\mathbf{6 0} .{ }^{26}$ This not only modestly improved the yield of the key cyclisation to 61, but more importantly, eased the subsequent removal of the protecting group. A series of steps involving the cleavage of the olefin in $\mathbf{6 1}$ ultimately provided diol $\mathbf{6 2}$, which was oxidised with TPAP to furnish lactone 63 as the major product, with only a small amount (5\%) of the other regioisomer. The rationale proposed for this surprising selectivity is the difference in steric environment experienced by the two hydroxymethyl substituents of 62, due to the presence of the $Z$-double bond and the carbamate group. ${ }^{26}$ The opening of the lactone ring followed by protection of the primary alcohol in $\mathbf{6 4}$, then treatment with NaH to promote Michael addition, provided the final ring of the desired tricyclic core in 65 in high yield.

61

62

Scheme 11: Cha's synthesis of the sarain core
Conversion of the protected primary alcohol 65 into aldehyde $\mathbf{6 6}$ followed by an aldol condensation-Tischenko reaction provided alcohol 67 (Scheme 12). A series of steps including an intramolecular Horner-Wadsworth-Emmons reaction then produced lactone 68, which was converted into a substrate for a ring-closing metathesis with second generation Grubbs' catalyst to furnish the 13 -membered macrocycle 69, and then transformed into 70. In addition, Cha has also brought a second compound through the synthetic route, where the 5 -membered lactam is protected with a $\left(\mathrm{CH}_{2}\right)_{4} \mathrm{OPMB}$ instead of the PMB group, with the purpose of providing a handle for future attachment of the eastern macrocycle. ${ }^{26}$

Scheme 12: Cha's synthesis of 70

### 1.3.5. Marazano's synthesis of the sarain core

The strategy adopted by Marazano is based upon their proposed biomimetic route to the sarain core, in which multiple condensations of amino-aldehyde and malondialdehyde units lead to a key intermediate 71 ( $c f .19$ in Scheme 2). ${ }^{12,27}$

Scheme 13

Thus Marazano's synthesis began by carrying out multi-component couplings, which first involved deprotonation of imine $\mathbf{7 2}$ and reaction with a bromoacrylamide derivative, followed by imine hydrolysis, to give amine salt 73 (Scheme 14). This was treated with malonaldehyde sodium salt to form intermediate 74, which was deprotonated to drive its cyclisation, and then methylated to provide the functionalised diazabicyclo[4.3.0]nonane 75, with a cis-fused ring junction. Reduction of the enaminal functionality by hydrogenation in the presence of catalytic quantities of $\mathrm{PtO}_{2}$ and $\mathrm{SnCl}_{2}$ provided alcohol 76 with only modest diastereoselectivity. Reduction of this material with DIBAH provided two distinct, separable compounds, 77 and 78, with the major product being tricycle 77 that possesses the correct relative stereochemistry.

Scheme 14

A Lewis acid mediated rearrangement of 77 gave enamine 79, and this was converted into aldehyde 80 in 5 steps via a nitrile intermediate. The closing stages of Marazano's route involved conversion of aldehyde $\mathbf{8 0}$ into allylsilane $\mathbf{8 1}$ for a ferric chloride
cyclisation to the tricyclic core analogue $\mathbf{8 2}$, a method akin to that previously utilised by Weinreb in the final step of his synthesis of the sarain core. ${ }^{13}$

## Scheme 15: Completion of Marazano's synthesis of the sarain core

### 1.3.6. Our synthetic approach

As a key intermediate in the total synthesis of sarain A, a synthesis of tricycle $\mathbf{8 3}$ is proposed. It contains the tricyclic framework of the sarain core, but with a ketosubstituent in place of the formyl group (Figure 6).

83

Sarain core

Figure 6: Synthetic target
It is anticipated that treatment of diazoketone $\mathbf{8 4}$ with a metal catalyst will lead to metallocarbene formation, followed by cyclisation from the more nucleophilic nitrogen to provide ammonium ylide 85 (Scheme 16). Subsequent C-N bond cleavage by ring opening from the neighbouring nitrogen, and an internal Mannich cyclisation of the enolate moiety onto the iminium ion in $\mathbf{8 6}$ provides target 83. In summary, this route involves a novel carbene-derived ammonium ylide rearrangement, so that in just one transformation, the relatively simple bicyclic compound $\mathbf{8 4}$ can be converted to the complex tricyclic target $\mathbf{8 3}$.

Scheme 16: Our synthetic strategy
There is little literature precedent for the rearrangement proposed in Scheme 16. However, similarities can be drawn with the use of sulfur ylides by Kametani and coworkers in their work towards the synthesis of pyrrolizidine alkaloids. ${ }^{28}$ The diazodecomposition of $\mathbf{8 7}$ followed by intramolecular trapping from the sulfur atom generated sulfur ylide 88, which underwent a ring opening/ring closure rearrangement to form bicycle 89 (Scheme 17).

Scheme 17

An intermolecular variant of this rearrangement that promotes ring expansions of 1,3oxathiolanes into 1,4-oxathianes has also been developed by our group (vide infra).

### 1.3.6.1. Previous work within the Porter group

A number of different strategies to synthesise bicyclic aminal $\mathbf{8 4}$ had previously been investigated by the group. ${ }^{29}$ However, all these syntheses were lengthy, low yielding, gave racemic products and moreover, were incomplete. In one approach to investigate the formation of the 5,5-bicyclic aminal system, $N$-benzylpyrrolidin-2-one was treated with LDA, then alkylated with allyl bromide to provide a terminal alkene. The alkene was subsequently cleaved by reductive ozonolysis to give primary alcohol 90 (Scheme 18). Mesylation and then azide displacement to give 91, followed by a reductive
cyclisation protocol developed within the group, ${ }^{30}$ produced the bicyclic aminal 92 . This was converted into formamide 93 , an analogue of target 84 that lacks the key side chain at C3.

Scheme 18: Preparation of bicyclic aminal 93
A proposed mechanism for the reductive cyclisation is detailed in Scheme 19; it begins with a Staudinger reaction of azide 91 to produce iminophosphorane 94. Subsequent hydride addition to effect partial reduction of the amide, followed by cyclisation of the nucleophilic iminophosphorane onto the iminium ion leads to bicycle 95. Finally, a loss of tributylphosphine oxide during aqueous workup provides the desired aminal 92.

Scheme 19: Proposed mechanism of reductive cyclisation
The simple bicyclic aminal $\mathbf{9 3}$ was treated with a silylated diazoester in the presence of a catalytic $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ to ascertain whether it would undergo an intermolecular variant of the intramolecular ring expansion reaction featured in our proposed route to the sarain core (see Scheme 16). However, rather than being the envisaged piperidine 96, the isolated product 97 was in fact the result of an unexpected olefination of the amide carbonyl (Scheme 20).

Scheme 20: Unexpected olefination of the formamide group

### 1.4. Aims

The aims of this research are:

- To develop a route to functionalised bicyclic aminal $\mathbf{8 4}$
- To investigate a carbene-derived ammonium ylide rearrangement as a route to tricycle 83, which bears the tricyclic framework of the sarain core
- To investigate the scope and limitations of the unexpected olefination reaction.

This research has been largely based around the aims listed above, the results of which will be discussed in turn. However, as the overall transformation in the conversion of ylide $\mathbf{8 5}$ to the tricycle $\mathbf{8 3}$ is essentially a Stevens rearrangement, albeit unusual in that it involves a neighbouring heteroatom, the next section will begin by introducing this reaction. The synthetic applications of the Stevens rearrangement of ammonium ylides will also be reviewed.

## 2. SYNTHETIC APPLICATIONS OF THE STEVENS REARRANGEMENT OF AMMONIUM YLIDES

Ammonium ylides are important intermediates in organic synthesis, as they are capable of rearrangements under mild conditions to generate a variety of nitrogen containing compounds in a stereoselective manner. The first example of an [1,2]-rearrangement of an ammonium ylide was published by Stevens in 1928. Under basic conditions, ammonium salt $\mathbf{9 8}$ was converted into product 100, a result of an [1,2]-benzyl shift in the intermediate ylide 99 (Scheme 21). ${ }^{31}$ This [1,2]-shift of a migrating group from a heteroatom to carbon is known as the Stevens rearrangement.

Scheme 21

The Stevens rearrangement is unlikely to proceed through a concerted [1,2]-shift, as it is a thermally forbidden process according to the Woodward-Hoffmann rules. ${ }^{32}$ Most evidence instead suggests that the shift proceeds via a radical pair mechanism. This involves homolytic cleavage of the $\mathrm{C}-\mathrm{N}$ bond in ylide 99 , generating a pair of radicals that are localised in a solvent cage. Rapid recombination to the more stable carbon radical centre then gives the rearranged product $\mathbf{1 0 0}$ (Scheme 22). ${ }^{33-35}$ This mechanistic pathway also accounts for the high stereoselectivity observed in the rearrangements, which proceed with retention of configuration of the migrating group. ${ }^{36}$

Scheme 22

### 2.1. Formation of ammonium ylides

Ammonium ylides ${ }^{37}$ were classically generated by base-promoted deprotonation of ammonium salts, but there are disadvantages to their preparation in this way. These include the requirement for a two step synthesis, involving initial formation of the quaternary salt, followed by deprotonation; the latter may occur unspecifically if there is more than one acidic site. In addition, Hoffmann elimination of the ammonium salts can also compete with the Stevens rearrangement (Scheme 23).

Scheme 23

Generation of ammonium ylides from the reaction of tertiary amines and carbenes is a useful alternative; it was first introduced by Stevens in 1952, whereby treatment of diazofluorene $\mathbf{1 0 1}$ with $N, N$-dimethylbenzylamine at elevated temperatures led to rearrangement product 102. ${ }^{38}$

Scheme 24

### 2.1.1. Carbenes and carbenoids

Carbenes are neutral divalent species containing a carbon with six electrons in its valence shell, generally denoted : $\mathrm{CR}_{2}$. The classic way to generate carbenes is the $\alpha$ elimination of hydrogen halides from haloforms by treatment with base to produce dihalogenocarbenes. They can also be generated from the thermolysis or photolysis of diazo compounds, liberating nitrogen and forming a carbene.

Free carbenes are highly energetic species exhibiting a (largely) electrophilic centre, and are thus able to react with relatively unreactive moieties in a number of different ways. For example, carbenes are able to react with benzene, breaking its aromaticity to form the unstable norcaradiene intermediate 103, which then undergoes an electrocyclic ring expansion to cycloheptatriene $\mathbf{1 0 4}$ (Scheme 25). ${ }^{39}$ Due to this reactivity, carbenes were first thought to be of limited value in organic synthesis, as the reactions are unspecific and difficult to control.

Scheme 25

Decomposition of diazo carbonyl compounds can be catalysed by the addition of transition metal catalysts, typically based around copper (e.g. $\left.\mathrm{Cu}(\mathrm{acac})_{2}\right)$ and rhodium (e.g. $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ ), to form metal carbenes. The metallocarbene thus formed reacts in a similar manner to the free carbene, but its greater degree of stabilisation offers better control of reactivity. Carbenes can react with unactivated C-H bonds to form new bonds at unfunctionalised centres; the reaction proceeds in a concerted fashion, so that if the C-H moiety is at a stereogenic centre the stereochemistry is retained. This chemistry was utilised by Cane to generate 105 in the total synthesis of pentalenolactone (Scheme 26), ${ }^{40}$ demonstrating the high selectivity that can be achieved with metallocarbenes.

Scheme 26

### 2.1.2. Formation of ylides from diazo carbonyl compounds

Metallocarbenes are generally highly electrophilic intermediates and so react readily with lone pairs of heteroatoms to give the corresponding ylides. Scheme 27 illustrates this catalytic cycle, whereby reaction of a diazo compound with an appropriate metal
catalyst eliminates nitrogen and generates the highly electrophilic carbenoid intermediate 106. Nucleophilic attack from a heteroatom (in this case, nitrogen) lone pair then generates 107, and dissociation of this intermediate to ammonium ylide 108 releases the metal back into the catalytic cycle.

Scheme 27: Ammonium ylide generation by metal catalysed diazodecomposition

### 2.2. Some competing reactions to the Stevens rearrangement

Even though the emphasis of this section is placed on the Stevens [1,2]-rearrangement, it is noteworthy that other than the desired rearrangement, ammonium ylides can undergo several other competing reactions, which increases the potential for side products. These include [2,3]-sigmatropic rearrangements, ${ }^{41}$ and a reaction of this type is the Sommelet-Hauser rearrangement. ${ }^{42}$ This chemistry was utilised in the synthesis of the benzo-fused azonane product 111, by treatment of ammonium salt 109 with base, then a ring expansion of the subsequent ammonium ylide $\mathbf{1 1 0}$ (Scheme 28). ${ }^{43}$ The [2,3]shift of ammonium ylides was also used by Clark to synthesise azalactone $\mathbf{1 1 3}$ from diazoester $\mathbf{1 1 2}$ in good yield. ${ }^{44}$

Scheme 28

In addition to the [2,3]-rearrangement, other reactions in competition with a Stevens rearrangement include fragmentation reactions, as was observed from treatment of azetidinone 114 with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$; formation of ylide $\mathbf{1 1 5}$ led to a proton abstraction from the benzylic carbon and cleavage of the N-O bond, losing benzaldehyde and forming carbapenam 116. ${ }^{45}$

Scheme 29
Additionally, if the ylide is prepared from a carbene, formation of the ylide is in competition with cyclopropanation and C-H insertion reactions. Although it is important to be aware of the potential for these competing side reactions, they are normally avoidable by selecting the correct substrate and catalyst, and thus the Stevens rearrangement has been an important tool in the generation of many nitrogen containing compounds. There have been many developments in this area in the last decade, which are reviewed in the next section.

### 2.3. New methodologies employing the Stevens rearrangement

### 2.3.1. Silyl-directed Stevens rearrangement of ammonium ylides

West and Vanecko have developed a silyl-directed Stevens rearrangement for the stereoselective synthesis of hydroxylated quinolizidines. ${ }^{46}$ This strategy began by preparing chiral silane $\mathbf{1 1 7}$ by asymmetric lithiation and silylation of the corresponding pyrrolidine. Conversion of silane 117 into the diazoketone 118, followed by treatment with $\mathrm{Cu}(\mathrm{acac})_{2}$ promoted a Stevens rearrangement of the intermediate ylide, and furnished the desired quinolizidine $\mathbf{1 1 9}$ as a single diastereoisomer in $58 \%$ yield and $77 \%$ ee (Scheme 30). The silyl group proved to be a suitable 'surrogate' to a hydroxyl group, as quinolizidine $\mathbf{1 1 9}$ was stereoselectively converted to quinolizidinediol $\mathbf{1 2 0}$ in excellent yields.

Scheme 30

### 2.3.2. Synthesis of $N$-fused tricyclic indoles

Iwasawa and co-workers have developed an efficient method for the construction of N fused tricyclic indole derivatives that proceeds via a Stevens rearrangement. ${ }^{47}$ Treatment of an irradiated solution of $o$-alkynylphenyl pyrrolidine derivatives $\mathbf{1 2 1}$ with $\mathrm{W}(\mathrm{CO})_{6}$, or the corresponding piperidine or morpholine derivatives $\mathbf{1 2 3}$ with $\operatorname{ReBr}(\mathrm{CO})_{5}$, provided indole products $\mathbf{1 2 2}$ and $\mathbf{1 2 4}$ respectively, both in good yields (Scheme 31).

Scheme 31

A proposed mechanism for this transformation involves the initial generation of the electrophilically activated alkyne complex $\mathbf{1 2 5}$ (Scheme 32). Nucleophilic attack from the amine then gives the metallated ammonium ylide 126, and a tandem Stevens rearrangement/1,2-alkyl shift completes the construction of indole products $\mathbf{1 2 2}$ and 124.

Scheme 32

### 2.3.3. Lewis acid mediated Stevens rearrangement of ammonium ylides

Somfai and co-workers have previously reported that glycine-derived $N$-allyl- N benzylamines can be converted into the corresponding homoallylic amines by sequential
treatment with $\mathrm{BBr}_{3}$ and base, ${ }^{48}$ as the result of a [2,3]-sigmatropic rearrangement. It had also been reported that when there are unfavourable steric interactions in the substrate for a [2,3]-shift, or when elevated reaction temperatures are used, the [1,2]rearrangement becomes a significant competing pathway to the [2,3]-rearrangement. ${ }^{49,50}$ Based on this work, Somfai and Tuzina embarked on an investigation to prepare [1,2]shift products in a similar way, using substrates that are less likely to undergo [2,3]shifts. As predicted, treatment of glycine-derivative 127 with $\mathrm{BBr}_{3}$ resulted in the formation of oxazaborolidine 128, which upon deprotonation gave ylide 129 and then rearrangement product $\mathbf{1 3 0}$ after hydrolysis (Scheme 33). ${ }^{51}$ This represents the first example of a Lewis acid mediated [1,2]-rearrangement of glycine derivatives. Optimal conditions involve the use of 1.2 equivalents of $\mathrm{BBr}_{3}$ and 5 equivalents of $\mathrm{Et}_{3} \mathrm{~N}$ in DCM under microwave heating, and were successful for a number of glycine derivatives.

Scheme 33

### 2.3.4. A diastereoselective approach to chiral $\alpha$-amino ketones

In 2004, Tomooka and co-workers described a novel Stevens rearrangement of cyclic hemiacetals as a diastereoselective approach to chiral $\alpha$-amino ketones. ${ }^{52}$ Treatment of racemic hemiacetal $( \pm)-\mathbf{1 3 1}$ with $\mathrm{KO}^{\mathrm{t}} \mathrm{Bu}$ in EtOH at room temperature furnished the hydroxy-ketone 132 in $35 \%$ yield and hemiacetal 133 in $40 \%$ yield, both as single diastereoisomers (Scheme 34). It was also observed that the hydroxy-ketone 132 easily cyclised to hemiacetal 133 on silica gel.

Scheme 34

The mechanism proposed for this rearrangement process is shown above; deprotonation of hemiacetal 131 gives alkoxide 134, which isomerises to acyclic form 135, and the alkoxide moiety acts as the intramolecular base to generate ammonium ylide $\mathbf{1 3 6}$ for rearrangement into $\mathbf{1 3 2}$. An asymmetric variant using chiral hemiacetal $(R) \mathbf{- 1 3 1}$ was also described, and under optimised conditions ( NaOH in $\mathrm{H}_{2} \mathrm{O}$ at $60^{\circ} \mathrm{C}$ ), provided the products $\mathbf{1 3 2}$ and $\mathbf{1 3 3}$ in $86 \%$ combined yield and $72 \%$ ee.

### 2.3.5. Chirality transfer from nitrogen to carbon

West and Glaeske have described a stereoselective route to $\alpha$-quaternary amino acid derivatives through a novel chirality transfer approach. ${ }^{53}$ This involved initial formation of optically active quaternary ammonium salts $\mathbf{1 3 7}$ from proline, and 139 from threonine, and then their subjection to $\mathrm{KO}^{\mathrm{t}} \mathrm{Bu}$ in THF. This led to the generation of ammonium ylides, which underwent a facially selective migration of one of the substituents on nitrogen to furnish the rearrangement products: 138a and 140a from [1,2]- and 138b and 140b from [2,3]-rearrangement (Scheme 35).

Scheme 35

If the mechanistic pathway for the rearrangement of the ammonium ylide (cf. 141, Scheme 36) was via a fast radical recombination process, a migration with retention of stereochemistry should provide [1,2]-benzyl shift products 138a and 140a as single diastereoisomers. However, 138a was obtained with an enantiomeric ratio of 3.3:1, and 140a with a diastereoisomeric ratio of 2.8:1. This suggests that radical pair recombination from the same face is competitive with that of diffusion to the opposite face or out of the solvent cage entirely. In contrast, the [2,3]-shift products 138b and 140b were obtained as a single enantiomer; this is because the rearrangement is a concerted process, thereby making the rearrangement enantiospecific.

Scheme 36

### 2.3.6. Synthesis of pyrrolidines and azepanes

Couty and co-workers have recently carried out a number of ring expansions of 2 alkenylazetidium salts to produce either 3-alkenylpyrrolidines $\mathbf{1 4 3}$ from [1,2]-shifts, or 4,5-dehydroazepanes $\mathbf{1 4 4}$ from [2,3]-shifts. ${ }^{54,55}$ These studies showed that preference for the formation of either product is determined by the relative stereochemistry between the substituent bearing the negative charge in the ammonium ylide and the adjacent alkene. When they are in a trans relationship, i.e. 142a, the two reacting centres that would lead to a [2,3]-shift product are too far apart, and deprotonation occurs at the benzylic position to produce the [1,2]-shift pyrrolidine product $\mathbf{1 4 3}$ exclusively (Scheme 37 ). Conversely, a [2,3]-shift takes place when the ylide and alkene are in a cis relationship; for example, deprotonation next to the ester moiety in 142b produces azepane $\mathbf{1 4 4}$ in excellent yields.

Scheme 37

### 2.4. Stevens rearrangements in natural product synthesis

### 2.4.1. Pyrrolizidine and indolizidine alkaloids

### 2.4.1.1. Pyrrolizidine alkaloids

West and co-workers demonstrated that the synthesis of turneforcidine $\mathbf{1 5 0}$ and platynecine 151, both pyrrolizidine alkaloids, could be quickly achieved through a ring expansion methodology. ${ }^{56}$ Azetidinecarboxylate $\mathbf{1 4 5}$ was efficiently converted into diazoketone 146 and as had been anticipated, treatment with $\mathrm{Cu}(\mathrm{acac})_{2}$ generated the spirocyclic ylide 147, which led to the [1,2]-shift products 148a and 148b in good yields and modest diastereoselectivity (Scheme 38). Subjection of this mixture to hydrogenation conditions led to a separable mixture of alcohol 149a and lactone 149b, which were then individually treated with $\mathrm{LiAlH}_{4}$ to provide the natural products $\mathbf{1 5 0}$ and 151 respectively, both in excellent yields.

Scheme 38

### 2.4.1.2. Indolizidine alkaloids

In an attempt to synthesise the related indolizidine alkaloids, which contain 6,5 -fused rather than 5,5 -fused bicycles, West and co-workers applied the same conditions, using $\mathrm{Cu}(\mathrm{acac})_{2}$, to the pyrrolidino diazoketone $\mathbf{1 5 2} .{ }^{56}$ However, under these conditions, only trace amounts of the indolizidine products 153a and 153b were obtained. Greater success was achieved by lowering the reaction temperature, with use of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ in refluxing benzene being optimal (Scheme 39).

Scheme 39

In studies towards the preparation of analogues of swansoamine, a potential anticancer agent, Saba and co-workers reported a similar approach to the synthesis of chiral indolizidines 156 and $156 b$, which differs from $153 a$ and $153 b$ by the presence of an ethyl ester at the bridgehead carbon (Scheme 40). ${ }^{57}$ Starting from chiral diazoester 154, high yields and enantioselectivity and good diastereoselectivity were observed. Formation of the indolizidines was found to proceed via the [5,5]-spirocyclic ylides 155a and 155b; the authors rationalised that the presence of the ester substituent on the ylide carbon improved the enantioselectivity in the rearrangement step, by the increased steric interaction with the approaching chiral migrating group.

In addition, it was found that by decreasing the reaction temperature using a refluxing solution of DCM , and using $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ as catalyst, ylides $\mathbf{1 5 5 a}$ and $\mathbf{1 5 5 b}$ were produced in $90 \%$ yield and 7:3 dr. Separation of the ylides and heating a solution of 155a or 155b in toluene in the absence of catalyst gave the rearrangement product 156a and $\mathbf{1 5 6 b}$ as single diastereoisomers in $83 \%$ and $85 \%$ yield respectively, both with $100 \%$ de and $95 \% e e$.

### 2.4.2. (-)-Epilupinine

A related ring-expansion approach was utilised by West in an enantioselective synthesis of (-)-epilupinine 161. ${ }^{58,59}$ Treatment of diazoketone 157 with a range of catalysts led to bicyclic [1,2]-rearrangement products 160a and 160b in excellent yields and good diastereoselectivity (Scheme 41). Conversion of 160b into a dithiolane intermediate, and subsequent reduction completed the synthesis of (-)-epilupinine 161.

Scheme 41

The selectivity in the rearrangement step was assumed to be mainly determined from which of the two rapidly interconverting pyramidal forms (158a and 158b) the ring nitrogen preferentially adopts. The major product $\mathbf{1 6 0 b}$ would require the preference for the formation of ammonium ylide diastereoisomer 159b, formed if the side chain of the carbenoid is in a trans relationship to the vicinal ester group (i.e. 158b), thereby minimising unfavourable steric interactions.

Whilst a rearrangement of ylide $\mathbf{1 5 9 b}$ with retention would have provided the bicycle 160b as an optically pure compound, NMR analysis using a chiral shift reagent indicated that that it was formed in only $65-75 \%$ ee at best. The authors agreed that the mechanism of rearrangement is likely to take place by the widely accepted mechanism, of initial homolysis of the C-N bond followed by a rapid radical recombination, but suggested that if the rate of migration is comparable to bond rotation, persistence of biradical 162 would decrease optical purity (Scheme 42). However, the high diastereoselectivity (up to $95: 5 d r$ ) in the reaction implies that stereoselective recombination of biradical $\mathbf{1 6 2}$ is also possible. This was rationalised by two possible rotamers of $\mathbf{1 6 2}$ that can be adopted prior to bond formation, in which the planar estersubstituted radical approaches the piperidone ring with either the larger ester, or the smaller hydrogen under the ring. Rotamer 162a requires unfavourable steric interactions between the ester and the ring, which are avoided with rotamer $\mathbf{1 6 2 b}$.

Scheme 42

### 2.4.3. Approaches to the morphine core and morphinomimetics

### 2.4.3.1. ( $\pm)$-Desoxycodeine-D

In his work towards the total synthesis of morphine, Cheng reported a novel route to ( $\pm$ )-desoxycodeine-D (165), a compound which incorporates the morphine skeleton. ${ }^{60}$ Polycyclic amine 163 was generated through a series of palladium-catalysed couplings, and upon treatment with MeI then PhLi, the resulting ammonium ylide $\mathbf{1 6 4}$ underwent
the anticipated Stevens rearrangement to provide ( $\pm$ )-desoxycodeine-D (165) in $83 \%$ yield over the two steps (Scheme 43).

Scheme 43

### 2.4.3.2. Functionalised isopavines as morpholinomimetics

Hanessian utilised a highly stereocontrolled, diastereoselective Stevens rearrangement to synthesise a number of isopavines. ${ }^{61}$ After conversion of aldehyde $\mathbf{1 6 6}$ into bridged amine 167 , sequential treatment of 167 with MeI and $\mathrm{KO}^{\mathrm{t}} \mathrm{Bu}$ furnished isopavine $\mathbf{1 6 8}$ in good yields (Scheme 44).

Scheme 44

This reaction can theoretically proceed through two different pathways, one of which generates the observed isopavine 168, and the other giving the isomeric product (cf. 172b, Scheme 45). In this reaction, as well as in analogous reactions on related amines with variations at C6, isopavine product 172a was obtained as a single regioisomer,
with none of $\mathbf{1 7 2 b}$ detected. An ionic mechanism was proposed by the authors to explain this phenomenon; deprotonation of a benzylic proton at C 7 in the ammonium salt 169 leads to ylide 170a, which fragments into the iminium anion 171a (or its diradical equivalent). This is in a favourable alignment for an intramolecular attack (or recombination) by the benzylic anion to generate 172a. Alternatively, deprotonation could be from the C 5 benzylic proton, generating ylide 170b, but leading to anion 171b (or diradical) that is destabilised by allylic 1,2-strain, and will ring-flip to a conformation that cannot cyclise.

In contrast, the isomeric structures (i.e. 172b) could be synthesised with tetracyclic compounds, and due to the skeletal similarities with the morphine backbone, Hanessian synthesised a number of tetracyclic analogues (e.g. 173, Scheme 46) as morphinomimetics. The results from preliminary biological testing of these compounds against the opiod receptors are encouraging. ${ }^{61}$

Scheme 46

### 2.4.4. Synthesis of benzodiazepinone and benzazepine alkaloids

Saba and co-workers utilised a Stevens rearrangement to generate a number of pyrrolo[1,2-a][1,4]benzodiazepinones. ${ }^{62}$ Treatment of tetrahydroquinazolidines 174 with either $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ or $\mathrm{Cu}(\mathrm{acac})_{2}$ led to diazodecomposition, then generation of spiro-[6,5]-ammonium ylide 175, which rearranged to products 176a and 176b. These products were obtained as single diastereoisomers, with the substituents at C3 and C4 being trans disposed (Scheme 47). Better yields were obtained when $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ was employed, exceeding the yields from reactions with $\mathrm{Cu}(\mathrm{acac})_{2}$ by $10-30 \%$.

Scheme 47

In their work directed towards the total synthesis of lennoxamine (180), Padwa and coworkers proposed the use of a Stevens rearrangement to generate the skeletal framework of the natural product, which is based upon an isoindolobenzazepine ring system. ${ }^{63}$ Attempts to convert ester 177a into the rearrangement precursor 178a by diazo transfer were unsuccessful, which the authors attributed to the lowered acidity of the benzylic protons, due to the presence of the group at C5 (Scheme 48). In agreement with this explanation, 177b, which lacks this methoxy group, was converted into 178b in excellent yields. Treatment of $\mathbf{1 7 8 b}$ with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ furnished isoindolobenzazepine 179 in good yields. Although this method was unsuccessful in synthesising lennoxamine (180), a number of indolobenzazepines were prepared in this way.

177a: $\mathrm{R}=\mathrm{OMe}$
177b: $R=H$

178a: no product
178b: (88\%)

Scheme 48

In addition, Padwa and co-workers envisaged a similar approach toward the preparation of (-)-cephalotaxine (184). ${ }^{63}$ In a model system, a number of spirocyclic ylides, such as 182, derived from treatment of the corresponding diazoacetoacetates 181 with $\mathrm{Cu}(\mathrm{acac})_{2}$, were successfully converted into the Stevens rearrangement benzazepine products 183 (Scheme 49). Notably, the reaction was slowed upon replacing the catalyst with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$, and provided a complex mixture of products.

Scheme 49

A related ring expansion method to give fused quinoxalinones $\mathbf{1 8 5}$ by Stevens rearrangement of a spiro-quinoxaline derived ammonium ylide was also reported by Arán and co-workers (Scheme 50). ${ }^{64}$ Additionally, the separable enantiomerically pure 1-phenyl-4,9-dioxohexahydropyrrolo[1,2- $d$ [ $[1,4]$ oxazepine- $9 \mathrm{a}(7 H)$-carboxylates
have been obtained in this way from $\mathrm{Cu}(\mathrm{acac})_{2}$-catalysed decomposition of an diazocarbonyl moiety tethered to a chiral morpholinone (186, Scheme 51). ${ }^{65}$

Scheme 50

Scheme 51

In conclusion, this section has shown that a variety of important alkaloid skeletons can be accessed in high yields using [1,2]-shifts of ammonium ylides. In particular, a number of ring expansion strategies have proven to be effective in the synthesis of natural products, and sets good precedent for the novel ylide generation-rearrangement process employed in our approach to the synthesis of the sarain core.

## 3. RESULTS AND DISCUSSION

As described in section 1.3.6, our group's approach to 83, which bears the tricyclic framework of the sarain core, involves a novel carbene-derived ammonium ylide rearrangement of diazoketone 84 (Scheme 52). As diazoketones are typically prepared from carboxylic acid derivatives, the construction of 188, a cis-fused octahydropyrrolo[2,3-b]pyrrole ring system bearing an endo acetic acid substituent at C3, was targeted.

Scheme 52

A number of different strategies were investigated, the results from which will be discussed in turn.

### 3.1. Strategy one - Diels-Alder reaction involving a chiral dienophile

Retrosynthetic analysis suggested that bicyclic aminal $\mathbf{1 8 9}$ could be produced from lactam 190, which itself could be derived from aldehyde 191 (Scheme 53). In the forward sense, it was expected that a reductive amination of this aldehyde would initiate a cascade of reactions: namely a cyclisation of amine 193 onto the lactone carbonyl, then ring opening to lactam 194, followed by collapse of the hemiacetal moiety to aldehyde 195. In the presence of the excess reducing agent remaining in the reaction, the aldehyde was expected to be reduced to the desired alcohol 190.

Aldehyde 191 could be derived from an oxidative cleavage of the double bond in 192, hence an enantioselective synthesis of this bicycle would provide all the required stereochemical information prior to transformation into the desired lactam material 190. A powerful method of creating such systems is via an asymmetric Diels-Alder reaction.

### 3.1.1. Dienes and Dienophiles

The Diels-Alder reaction is an extremely useful tool in organic synthesis and has been integral to the synthesis of many complex molecules. ${ }^{66}$ Through a [4+2]-cycloaddition between a diene and an alkene, the reaction generates six-membered ring systems, creating up to four stereocentres in the cyclohexene ring in a single step. Since its discovery 80 years ago, significant developments have made it possible to achieve asymmetric induction in this reaction, usually by the use of chiral Lewis acid catalysts, or with chiral auxiliaries attached to either the diene or dienophile.

To generate the bicyclic system in 192, the dienophile component would need to be based upon furanone derivative 194 with an auxiliary attached at R' (Figure 7). An auxiliary which has proven to be effective in achieving high diastereoselectivity is the menthyloxy group developed by Feringa. ${ }^{67}$ As with most chiral auxiliaries, the face selectivity of this reaction is governed sterically, where the large menthyloxy group at the C5 position of the dienophile effectively shields one of the $\pi$-faces from approach by the diene.

Figure 7: Face selective addition of diene to chiral dienophile

It is well documented that there is a preference for the formation of endo-adducts in Diels-Alder reactions. ${ }^{68}$ Feringa used extensive COSY and NOESY NMR analysis of the product derived from the reaction of this dienophile with cyclopentadiene to confirm that endo-addition took place with $>96 \% d e .{ }^{67}$ In addition, Feringa has also shown that reactions of the menthyloxy dienophile with 2-methylbutadiene, 2,3-dimethylbutadiene, 1,3-cyclohexadiene, butadiene and 2-trimethylsilyloxy-1,3-butadiene all took place with excellent diastereoselectivity and enantioselectivity. ${ }^{67}$ These results would therefore suggest that, combined with the correct enantiomer of menthol, the dienophile should proceed to react with the selected butadiene to provide our desired bicycle 192 in good diastereoselectivity.

High levels of regiocontrol can also be expected by the use of a 2 -alkoxy-1,3-butadiene. This regioselectivity can be explained using frontier molecular orbital (FMO) theory. A pericyclic reaction involves the interaction of the highest occupied molecular orbital (HOMO) of one component, and the lowest unoccupied molecular orbital (LUMO) of the other. A successful reaction is based upon the successful overlap of these orbitals. A small difference in energy between the HOMO and LUMO lowers the activation energy, and ultimately increases the rate of reaction. In this Diels-Alder reaction, the overlap of the LUMO of the electron poor dienophile with the HOMO of the electron rich diene is the more important interaction. The presence of an electron withdrawing group (EWG) on the dienophile makes the LUMO coefficient at C4 larger than that of C3, and an electron donating group (EDG) at C2 of the diene contributes to a higher HOMO coefficient in C 1 in comparison to C 4 (Figure 8). This difference in size of the coefficients is important in the regioselectivity of the cycloaddition, as the new bonds are formed preferentially with a 'large-large' and 'small-small' overlap. Therefore a Diels-Alder reaction between menthyloxy-furanone 194 ( $\mathrm{R}^{\prime}=$ menthyloxy) and 2-
alkoxy-1,3-butadiene 193 is expected to take place regioselectively, and diastereoselectively, to give the desired "pseudo-para" adduct 192.

Figure 8

### 3.1.2. Results and Discussion

Preparation of the dienophile started with the reaction of furfural with singlet oxygen (Scheme 54). ${ }^{69}$ In the presence of rose bengal, dioxygen is excited to the singlet state, and then undergoes a Diels-Alder reaction with furfural to give a transient bicyclic intermediate. A nucleophilic attack by methanol at the aldehyde moiety then leads to elimination of methyl formate to break the weak O-O bond and give furanone 195.

Scheme 54: Preparation of chiral dienophile 197

To establish chirality within the dienophile, alcohol 195 was treated with L-menthol ${ }^{*}$ and catalytic CSA under Dean-Stark conditions to give a quantitative yield of furanones 196 and 197 as an approximately $1: 1$ mixture of diastereoisomers. ${ }^{69}$ Following chromatography to remove rose bengal, the diastereoisomers were separated by three

[^0]recrystallisations from petroleum ether, providing 197 in $34 \%$ yield and $>95 \%$ de. The unwanted diastereoisomer 196 was recycled by epimerisation with CSA in DCM, with subsequent recrystallisations providing a further crop of 197 in $24 \%$ yield.

In the original strategy, the diene of choice was 2-trimethylsilyloxy-1,3-butadiene (198). This diene was successfully utilised by Feringa and co-workers in a Diels-Alder reaction with dienophile 197, but the resulting adduct was immediately deprotected in the next step. ${ }^{67}$ In our hands, reproduction of this Diels-Alder reaction took place smoothly, but the purification of the resulting labile trimethylsilyl enol ether adduct 199 was difficult. ${ }^{70}$ Subjecting impure material to the oxidative cleavage reaction to aldehyde-acid 200 was unsuccessful (Scheme 55).

Scheme 55

Unfortunately, the use of bulkier, and hence more stable, tert-butyldimethylsilyloxy and triisopropylsilyloxy protecting groups only led to a vast decrease in the rate of the DielsAlder reaction. After a search for dienes that were successful in both reactions, 2-methoxy-1,3-butadiene was identified to be the best substrate. ${ }^{70}$

In contrast to the one step procedures used to make silyloxy-substituted dienes, the preparation of 2-methoxy-1,3-butadiene necessitated two steps (Scheme 56). ${ }^{71}$ Treatment of methyl vinyl ketone with MeOH in the presence of TsOH and trimethyl orthoformate promoted conjugate addition and acetal formation to generate 1,3,3trimethoxybutane (201) in good yield. Subsequent treatment with $\mathrm{KHSO}_{4}$ at elevated temperature led to elimination of methanol and furnished diene $\mathbf{2 0 2}$ in $34 \%$ yield.

Scheme 56: Preparation of 2-methoxy-1,3-butadiene

The Diels-Alder reaction was carried out using two different methods of heating (Table 1 ); the results are directly comparable in terms of scale of reaction ( 1.5 g of dienophile) and volume of solvent used. The first was performed in a sealed tube heated at $120^{\circ} \mathrm{C}$ (entry 1), and the reaction was still incomplete even after prolonged heating. The use of microwave radiation at a higher temperature clearly provided better results (entry 2), with a markedly increased rate of reaction and also an improved yield.

Table 1: Diels-Alder reaction of chiral dienophile with methoxy-butadiene

| Entry | Method | Temperature $/{ }^{\circ} \mathbf{C}$ | Time /h | Yield / \% |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Thermal sealed tube | 120 | 168 | 53 |
| 2 | Microwave sealed tube | 180 | 2 | 70 |

### 3.1.3. Oxidative cleavage of Diels-Alder adduct

The oxidative cleavage reaction to convert methyl enol ether 203 into aldehyde-ester 204 proved capricious. Early examinations suggested that the optimum conditions were to carry out the ozonolysis in a mixture of $\mathrm{MeOH} / \mathrm{DCM}$, with a $\mathrm{PPh}_{3}$ reductive workup. ${ }^{70}$ However, only a very small amount of the desired product ( $\sim 2 \%$ ) was isolated when the same conditions were repeated. Consequently, reproducible conditions for the oxidative cleavage step were sought (Table 2).

The substrate was treated with ozone under different solvent and reductive workup conditions, with varying degrees of success. Initially, the disappointing yield from the previously mentioned reaction with $\mathrm{PPh}_{3}$ workup (entry 1) was attributed to the difficulty in separating the product from triphenylphosphine oxide. As a result, the reaction was repeated, substituting $\mathrm{PPh}_{3}$ with $\mathrm{PBu}_{3}$, as tributylphosphine oxide is more water soluble, and therefore more easily removed. However, only a small amount of material was recovered after flash chromatography, containing only trace amounts of the desired product.

Table 2: Oxidative cleavage of Diels-Alder adduct

| Entry | Reagents | Solvent | Yield | Notes |
| :---: | :---: | :---: | :---: | :---: |

${ }^{\text {a }}$ peak in ${ }^{1}$ H NMR spectrum corresponding to acetal proton observed predominantly at 5.8 ppm (see text); ${ }^{\text {b }}$ anhydrous conditions; ${ }^{\text {c }}$ impure - inseparable mixture

Closer inspection of the ${ }^{1} \mathrm{H}$ NMR spectra of the crude and partially purified products from entries 3-5 revealed they had a signal at $\sim 5.8 \mathrm{ppm}$ for the acetal OCHO proton, rather than at the expected $\sim 5.5 \mathrm{ppm}$ observed from previously prepared authentic samples. In addition, the two protons at $\sim 3 \mathrm{ppm}$ (corresponding to one proton $\alpha$ - to the aldehyde, and another $\beta$ - to the aldehyde) were absent. Although this undesired product was neither isolated nor definitely identified, the results from preliminary and tentative 2D NMR (COSY, HMQC, HMBC) analysis of the impure material are in agreement with a structure that has the acetal proton in the $\beta$-position to the aldehyde moiety, leading to the proposed structure 205 (Scheme 57).

## desired product

product proposed to be

Scheme 57: Isomerisation of Diels-Alder adduct before ozonolysis

This compound is assumed to arise from double bond isomerisation of Diels-Alder adduct $\mathbf{2 0 3}$ to $\mathbf{2 0 6}$ before the reaction with ozone. Isomerisation of an oxy-substituted double bond of a 5,6 -fused ring system is not without precedent; Meyers ${ }^{72}$ carried out a Diels-Alder reaction of chiral bicycle 207 with 2-(tert-butyldimethylsilyloxy)-1,3butadiene in excellent yield, but the double bond of their adduct isomerised from the initial C8-C9 to the C9-C10 position upon purification (Scheme 58). This isomerisation was only observed in adducts possessing an oxygen substituent at C 9 , and was attributed to be the result of the greater thermodynamic stability of the enol ethers at the C9-C10 position. ${ }^{72}$

Scheme 58

This isomerisation is assumed to be acid catalysed, via protonation of the double bond, followed by deprotonation at the alternative site, so with the aim of preventing this, ozonolysis was carried out in the presence of $\mathrm{NaHCO}_{3}$ (entry 4), but the acetal proton peak at $\sim 5.8 \mathrm{ppm}$ still predominated in the ${ }^{1} \mathrm{H}$ NMR spectrum of the product. When the ozonolysis was repeated in DCM alone under anhydrous conditions, the desired product was produced within an inseparable mixture of impurities, albeit in low yields. The best yields were obtained using anhydrous conditions with the addition of a Sudan Red indicator. When this solution became decolourised, signifying an excess of ozone, the reaction was immediately purged with argon and then DMS was added. Under these conditions, the desired product $\mathbf{2 0 4}$ was attained in low, but consistent yields.

An attempt to cleave the alkene with a high valent ruthenium species failed to provide the desired product 204.

### 3.1.4. Use of isoprene

Due to the isomerisation behaviour of the methyl enol ether, an analogous simple methyl alkene adduct was prepared by a Diels-Alder reaction of the chiral dienophile with isoprene. Adducts 208a and 208b were obtained in excellent yields but as a mixture of regioisomers (1:1 by ${ }^{1} \mathrm{H}$ NMR spectroscopy, Scheme 59 ). Their separation was possible, but required multiple recrystallisations from hexanes.

Scheme 59: Diels-Alder reaction with isoprene
Attempts to improve the regioselectivity of the reaction by addition of $\mathrm{AlCl}_{3}{ }^{73}$ led to a complex mixture of products.

It was hoped that the two isomers would be easier to separate at a later stage, and thus the synthesis was progressed using the regioisomeric mixture. However, subsequent reactions, either ozonolysis to $\mathbf{2 0 9}$ or acetal exchange to $\mathbf{2 1 0}$, resulted only in a low yield of inseparable regioisomers (Scheme 60).

Scheme 60

### 3.1.5. Reductive amination-cyclisation cascade

Returning to aldehyde-ester 204, studies into the proposed reductive amination-cyclisation-reduction cascade to lactam 213 were carried out (Scheme 61). Upon treatment of aldehyde 204 with benzylamine, formation of the imine was straightforward, as evident from carrying out the reaction in $\mathrm{CD}_{3} \mathrm{OD}$, and monitoring by NMR spectroscopy. However, reduction of this imine and the subsequent cascade were rather more difficult.

An investigation into various reductive amination conditions was carried out and encouragingly, loss of menthol was observed for almost all of the reaction conditions, but unfortunately none of the correct product 213 was isolated. However, there were indications that the cascading reaction had at least progressed somewhat - the tentatively assigned ${ }^{1} \mathrm{H}$ NMR spectra of the partially purified products from reduction with $\mathrm{NaBH}_{4}$ in MeOH showed an impure mixture of diastereoisomers 212 and 212a (Scheme 62).

Scheme 62

It is possible that this result arose because the reduction of the imine to amine $\mathbf{2 1 1}$ is fast, but the cyclisation of the amine onto the lactone and subsequent steps are slow. During this time the excess $\mathrm{NaBH}_{4}$ may have been hydrolysed in MeOH , and consequently unable to reduce the aldehyde to the alcohol. This would therefore render the chiral centre next to the aldehyde susceptible to epimerisation, and give rise to diastereoisomers 212 and 212a.

With the intention of reducing the susceptibility of $\mathrm{NaBH}_{4}$ to premature alcoholysis, the reductive aminations were carried out with varying amounts of $\mathrm{NaBH}_{4}$ and in a number of alcoholic solvents: MeOH , EtOH and ${ }^{\mathrm{i}} \mathrm{PrOH}$. In the instances when MeOH was used, a small amount of the impure diastereoisomeric aldehydes 212 and 212a were formed, even when the reactions were carried out in a greater excess of $\mathrm{NaBH}_{4}$, and also when more reagent was introduced portionwise over a period of time. Increasing the steric bulk of the solvent to EtOH or ${ }^{\mathrm{i}} \mathrm{PrOH}$ gave a complicated and intractable mixture of compounds, and the ${ }^{1} \mathrm{H}$ NMR spectra of the partially purified fractions all contained menthol-like peaks, which suggests that the menthyloxy moiety is retained in the product(s), and that the cyclisation or the elimination of menthol did not take place.

It was also difficult to identify products derived from reactions with $\mathrm{NaBH}(\mathrm{OAc})_{3}$ or from $\mathrm{NaBH}_{3} \mathrm{CN}$ with $\mathrm{ZnCl}_{2}$. However, in almost all cases, the ${ }^{1} \mathrm{H}$ NMR spectra of the partially purified products showed the presence of more benzyl peaks than expected, and also the absence of the methyl ester peak. This could be the result of a displacement of the methyl ester by benzylamine to form a benzylamide. Carrying out the reaction in ${ }^{i} \mathrm{PrOH}$ and reduction with $\mathrm{NaBH}_{3} \mathrm{CN}$ and $\mathrm{ZnCl}_{2}$ led to the isolation of N -benzyl-3-( N -benzyl-5-oxopyrrolidin-3-yl)pyrrolidin-2-one (215).

Scheme 63: Double reductive amination-cyclisation cascade

Its formation is thought to be via a double reductive amination-cyclisation mechanism, whereby aldehyde 212 undergoes a second reductive amination with benzylamine to form amine 214, which can then cyclise onto the methyl ester and form the second pyrrolidinone ring in 215 (Scheme 63). The presence of $\mathrm{ZnCl}_{2}$ in the reaction mixture was thought to assist the displacement of the methyl ester, but removing it from the reaction only led to a much more complicated set of products.

It was felt that if a clean sample of aldehyde $\mathbf{2 1 2}$ could be obtained, the problem of epimerisation of the chiral centre could be resolved later. Thus reducing agents that have been used in reductive amination reactions, but do not generally reduce aldehydes to alcohols were also investigated. Use of formic acid with $\mathrm{Pd} / \mathrm{C}$ catalyst, ${ }^{74}$ or use of $\mathrm{H}_{2}$ gas over $\mathrm{Pd} / \mathrm{C}$, provided a complex mixture of compounds. Hantzsch's base 216 was easily prepared in high yield (Scheme 64); ${ }^{75}$ however, no product was identified from the attempted reductive amination reaction with this reagent.

Scheme 64: Preparation of Hantzsch's base

Whilst these reaction conditions were unsuccessful in producing lactam 213, it was promising that menthol was produced from the reactions, and in one case, pyrrolidinone 215 was also isolated. This suggests that the amine derived from the reductive amination reaction is capable of cyclising onto the lactone carbonyl, and subsequently eliminating menthol. The problems in attaining the desired lactam may have been contributed to by the difficulty in getting pure starting material 204, and hence not being able to accurately introduce only one equivalent of benzylamine into the reaction mixture. The difficulties in the identification of side products from the ozonolysis and the subsequent reductive amination-cyclisation reactions were also exacerbated by the presence of menthol in the structure. This bulky leaving group may also have an effect on the ease of cyclisation, as reductive amination with $\mathrm{NaBH}_{4} / \mathrm{EtOH}$ (entry 2) provided a set of products that all still contained the menthol moiety. Attention therefore turned to removing the menthol moiety prior to oxidative cleavage.

### 3.1.6. Removal of the menthol moiety

### 3.1.6.1. Acetal exchange

Feringa ${ }^{67}$ has demonstrated the possibility of methanolysis of a menthyloxy group after the Diels-Alder reaction, by heating the adduct derived from reaction with
cyclopentadiene with $p \mathrm{TsOH}$ in MeOH . However, when the same conditions were applied to enol ether 203, dimethyl acetal 217 was produced (Scheme 65).

Scheme 65: Methanolysis of menthol moiety

In an attempt to produce the methoxy-derivative of menthyloxy adduct 203 directly, 5-methoxy-2-(5H)-furanone (218) was prepared from the corresponding hydroxyfuranone 195 (Scheme 66). Although aware that this would result in a lack of face selectivity in the Diels-Alder reaction, it would provide an insight into whether it was menthol that was limiting the progress in subsequent transformations. Disappointingly, Diels-Alder adduct $\mathbf{2 1 9}$ was produced in only moderate yields, and the subsequent ozonolysis to $\mathbf{2 2 0}$ occurred in very poor yield.

Scheme 66: Preparation and reaction of 5-methoxy-2-(5H)-furanone

### 3.1.6.2. Complete removal of the alkoxy group

A search in the literature showed that removal of the menthyloxy group from 5-menthyloxy- $\gamma$-lactones can be achieved by addition of KOH and $\mathrm{NaBH}_{4}$, and has been used by Pelter and Ward ${ }^{76}$ in their synthesis of lignans and by the Pete group ${ }^{77}$ in their total syntheses of ( - )-isoretronecanol and ( + )-laburnine. It is believed that base-induced ring opening of the lactone to hemiacetal 221, followed by elimination of menthol, reduction of the resulting aldehyde, and cyclisation of the alcohol onto the carboxylic acid provides the dementhylated lactone 223 (Scheme 67).

Scheme 67: Mechanism for the removal of menthyloxy group
Completely removing the alkoxy group would also remove the problem of a second reductive amination in the subsequent steps ( $c f$. Scheme 63), as cyclisation onto the lactone carbonyl would lead directly to an alcohol, without the need to go through a hemiacetal/aldehyde intermediate.

Investigations into the removal of the menthyloxy group from Diels-Alder adduct 203 are presented in Table 3. Due to the acidic proton at the chiral centre $\alpha$ - to the aldehyde in intermediate 222, the reactions were carried out by a dropwise addition of the base into the stirred solution of the substrate and $\mathrm{NaBH}_{4}$ at $0^{\circ} \mathrm{C}$, so that upon formation, the aldehyde could be quickly reduced and epimerisation of this chiral centre avoided. To our knowledge, dementhylation in the literature was almost always carried out using metal hydroxides as base, but when this method was applied on substrate 203, only a complex mixture of products was obtained (entries 1 and 2). However, on one occasion when 1 M ethanolic solution of KOH was used, the diethyl acetal derivative of the desired enol ether 224, ( $3 \mathrm{a} R, 7 \mathrm{aS}$ )-5,5-diethoxyhexahydroisobenzofuran-1(3H)-one (225) was isolated in $39 \%$ yield (entry 3).

Table 3: Removal of menthyloxy moiety from Diels-Alder adduct 203 ${ }^{\text {a,b }}$

| Entry | Eq. of <br> $\mathbf{N a B H}_{\mathbf{4}}$ | Base | Solvent | pH at <br> workup | Yield / <br> $\%$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $2.6^{\mathrm{c}}$ | $20 \%$ aq. KOH | MeOH | $3^{\mathrm{d}}$ | 0 |
| 2 | $25^{\mathrm{e}}$ | 2 M NaOH | $\mathrm{MeOH}, \mathrm{THF}$ | $1^{\mathrm{d}}$ | 0 |

| Entry | Eq. of <br> $\mathbf{N a B H}_{\mathbf{4}}$ | Base | Solvent | pH at <br> workup | Yield / <br> \% |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 6.5 | 1 M ethanolic KOH | EtOH | $3^{\mathrm{d}, \mathrm{f}}$ | $0^{\mathrm{g}}$ |
| 4 | 1.3 | NaOMe | MeOH | - | 0 |
| 5 | 1.3 | NaOMe | MeOH | $7^{\mathrm{h}}$ | see text |
| 6 | 10 | NaOMe | MeOH | $7^{\mathrm{h}}$ | see text |

${ }^{\text {a }}$ Typical procedure involves addition of $\mathrm{NaBH}_{4}$ then base, followed by aqueous workup; ${ }^{\text {b }}$ menthol always isolated; ${ }^{\mathrm{c}} 1.3$ eq. then extra 1.3 eq. after $6 \mathrm{~h} ;{ }^{\mathrm{d}}$ acidified with $2 \mathrm{M} \mathrm{HCl} ;{ }^{\mathrm{e}} 20 \mathrm{eq}$. initially then extra 5 eq. after addition of base; ${ }^{\mathrm{f}}$ organic extract from acidic workup stirred for 62 h ; ${ }^{\mathrm{g}}(3 \mathrm{a} R, 7 \mathrm{aS})$-5,5-diethoxyhexahydroisobenzofuran-1(3H)one ( $\mathbf{2 2 5}, \mathbf{3 9 \%}$ ) isolated; ${ }^{\text {h }}$ neutralised with $\mathrm{pH} 7 \mathrm{KH}_{2} \mathrm{PO}_{4} / \mathrm{KOH}$ buffer

If the proposed mechanism of dementhylation is correct, then changing the base to NaOMe should have no effect on the net result. The advantage of using NaOMe is that the intermediates contain an ester functionality rather than a carboxylate, and will not require an acidic workup. Thus when NaOMe was used, the reaction mixture was neutralised to pH 7 before concentration. The crude product was partially purified into three main fractions; the ${ }^{1} \mathrm{H}$ NMR spectra of these fractions all confirmed the presence of a lactone $\mathrm{CH}_{2}$ group, and from the remaining peaks, the compounds were tentatively assigned to be the desired product 224, 226 from methanolysis, and 227 from hydrolysis of the enol ether (Scheme 68).

Scheme 68: Tentatively assigned products of dementhylation reactions with NaOMe

### 3.1.6.2.1 A model substrate

To ascertain whether the problems of dementhylation were due to the procedure or the substrate, it was decided to test this reaction on a simple model, 5-menthyloxy-2-(5H)furanone 197, which does not contain the labile enol ether (Table 4).

Although menthol was isolated upon treatment of acetal 197 with $\mathrm{NaBH}_{4}$ and either with KOH or NaOMe as base, no other product was identified when using KOH. With NaOMe , it appeared that the double bond was also reduced to form $\gamma$-butyrolactone. Although the method of using NaOMe in MeOH is shown to be successful in removal of the menthyloxy group in both substrates 197 and 203, it became clear that pursuance of this route would be challenging due to problems with the labile methyl enol ether in Diels-Alder adduct 203.

Table 4: Dementhylation with $\mathrm{NaBH}_{4}$ (2.0 eq.) and base

| Entry | Base | Solvent | pH during workup | Yield / \% |
| :---: | :---: | :---: | :---: | :---: |
| 1 | KOH | MeOH | 7.0 | 0 |
| 2 | NaOMe | MeOH | 7.0 | $0^{\mathrm{a}}$ |

### 3.1.6.3. Diels-Alder reaction with 2-(5H)-furanone

To circumvent the observed problems in the removal of the menthyloxy moiety, the Diels-Alder reaction was carried out with a simple unsubstituted furanone. Following the procedure of Näsman, ${ }^{78}$ a Baeyer-Villiger reaction of furfural followed by fragmentation of the resulting formate provided $2-(5 \mathrm{H})$-furanone (228). However, the Diels-Alder reaction provided 229 in low yields, possibly due to the absence of an oxygen substituent at the C 5 position of the furanone, rendering it a weaker dienophile. Unfortunately low yields continued to prevail upon transformation of $\mathbf{2 2 9}$ into $\mathbf{2 3 0}$.

Scheme 69: Preparation and reaction of 2-(5H)-furanone

### 3.1.7. Nitrosation of Diels-Alder adducts

The search for further manipulations of the Diels-Alder adducts revealed that the cleavage of 1,2-dione monooximes with $\mathrm{SOCl}_{2}$ can provide the corresponding esternitrile functionalities (Scheme 70). ${ }^{79}$ Successful application of this chemistry on a substrate such as oxime $\mathbf{2 3 1}$ would therefore provide 232, whereupon a reduction of the nitrile moiety would provide the free amine $\mathbf{2 3 3}$ for our reductive amination-cyclisation protocol.

Scheme 70: Cleavage of $\mathbf{1 , 2}$-dione monooxime with $\mathbf{S O C l}_{2}$
Hassner ${ }^{80}$ showed that nitrosation of carbonyl compounds can be carried out by addition of nitrosyl chloride to trimethylsilyl enol ethers (Scheme 71). In addition, the work of Nagendrappa ${ }^{81}$ showed that is possible to effect $\alpha$-oximation of ketones to 1,2 -dione monooximes 234 in high yields by generating nitrosyl chloride in situ using a combination of trimethylsilyl chloride and isoamyl nitrite.

Scheme 71: Preparations of 1,2-dione monooximes

To prepare a substrate for the investigation of nitrosation reaction conditions, a DielsAlder reaction between chiral butenolide 197 and 2-trimethylsilyloxy-1,3-butadiene was carried out to provide the required adduct 199, for further transformation into oxime 231 (Scheme 72).

Scheme 72: Preparation of trimethylsilyloxy enol ether adduct

Due to the labile nature of the TMS enol ether, purification was avoided and the crude reaction mixture was subjected to Nagendrappa's conditions to generate NOCl in situ. Treatment with isoamyl nitrite and catalytic or stoichiometric quantities of TMSCl only gave an unidentified mixture of products.

Leeper ${ }^{82}$ was successful in utilising Tanimoto's Lewis acid promoted nitrosation reaction ${ }^{83}$ to convert silyl enol ether $\mathbf{2 3 5}$ into an $\alpha$-keto oxime in their synthesis of chiral polycyclic thiazolium salts (Scheme 73). However, when analogous conditions ${ }^{83}$ were applied on our substrate, using AmONO rather than BuONO, no product was isolated, but the menthyl group appeared to have been exchanged for an isoamyl group, probably facilitated by the Lewis acid.

Scheme 73
As a result of the difficulties with nitrosation of the TMS enol ether, the target substrate was changed to ketone 236, anticipating that nitrosation would take place at the desired, more accessible position. As well as being a readily purified starting material, this ketone had the added advantage that it could be treated to the dementhylation conditions without the problems associated with the alcoholysis or hydrolysis of the labile enol ethers.

Removal of the TMS protecting group in 199 with TBAF was low yielding (entry 1, Table 5), while an improvement was attained by changing the fluoride source to $\mathrm{NH}_{4} \mathrm{~F}$. With the intent of either purifying or deprotecting the crude silyl enol ether 199, it was passed through chromatography column on silica gel, and the desired ketone product

236 was obtained in $70 \%$ yield (entry 4). However, it was observed that a small amount of what is assumed to be impure silyl enol ether 199 was also collected. With this in mind, the crude enol ether was initially treated with silica before the column (entries 5 and 6), but provided the ketone product in lower yields than for simply loading directly onto the column. This suggests that ketone $\mathbf{2 3 6}$ has limited stability to acidic conditions.

Table 5: Deprotection of OTMS enol ether

| Entry | Conditions | Yield / \% |
| :---: | :---: | :---: |
| 1 | TBAF, THF | 20 |
| 2 | $\mathrm{NH}_{4} \mathrm{~F}, \mathrm{MeOH}$ | 56 |
| 3 | $3 \mathrm{M} \mathrm{HCl}, \mathrm{DCM}$ | 3 |
| 4 | Column on silica gel support | 70 |
| 5 | Adsorb onto silica, leave overnight then column | 43 |
| 6 | Stir in silica in $50 \% \mathrm{MeOH} / \mathrm{DCM}$ overnight then column | 33 |

Unfortunately, the nitrosation reaction to give $\mathbf{2 3 1}$ continued to be problematic, and although the reaction of ketone $\mathbf{2 3 6}$ was significantly cleaner than that of the silyl enol ether, none of the desired product was isolated. To minimise the possibility that the lack of success in this reaction was due to the purity of the reagents, isoamyl nitrite was prepared using a procedure described by Maskill. ${ }^{84}$ Treatment of isoamyl alcohol with sodium nitrite and concentrated sulfuric acid in the absence of organic solvent provided isoamyl nitrite in not entirely pure form, but it was cleaner by ${ }^{1} \mathrm{H}$ NMR spectroscopy than the commercial material (Scheme 74). When used in the nitrosation reaction, again the reaction was cleaner, but again no product was isolated.

Scheme 74: Preparation of isoamyl nitrite

After a laborious and unsuccessful investigation into the possibility of using the DielsAlder reaction of butenolides in our synthesis of the sarain core, this route was abandoned.

### 3.2. Strategy two: $N$-tosyl-1H-pyrrol-2(5H)-one as dienophile

In another Diels-Alder approach, an asymmetric catalyst rather than a chiral auxiliary was employed to induce enantioselectivity. Corey and co-workers have published several papers detailing the protonation of oxazaborolidines with either triflic acid ${ }^{85,86}$ or triflimide ${ }^{87,88}$ to generate chiral boron Lewis acids that are highly effective in catalysing the reactions between a wide variety of dienes and dienophiles (Scheme 75). Dienophiles used include dimethyl fumarate, 2-substituted acroleins, cyclic $\alpha, \beta$-enones and quinones. ${ }^{88}$

Scheme 75

Corey proposed that the face selectivity of the reaction is governed by the co-ordination of the Lewis acid catalyst to the dienophile, which forces the diene to approach from the convex face of the bicyclic catalyst, away from the two bulky aromatic rings (Figure 9). As shown, the predicted selectivity depends on the nature of the dienophile, where $\alpha, \beta$ unsaturated enals are proposed to coordinate through the carbonyl oxygen and the aldehyde hydrogen, whereas $\alpha, \beta$-unsaturated esters adopt a different geometry, coordinating through the hydrogen $\alpha$ - to the ester functionality.

Figure 9

Retrosynthetic analysis suggested that bicyclic aminal 189 could be derived from 237, produced as a result of cleavage of the Diels-Alder adduct 238 (Scheme 76). An advantage to this Diels-Alder approach is that use of a pyrrol-2(5H)-one would avoid the problems encountered with the reductive amination-cyclisation-fragmentation approach employed in the previous study with furanones.

Scheme 76: Retrosynthetic route using $N$-tosyl-1H-pyrrol-2(5H)-one as dienophile

Previous work in our group involved an investigation into the reaction of N -tosyl- 1 H -pyrrol-2(5H)-one (239) with 2-(tert-butyldimethylsilyloxy)-1,3-butadiene (193, $\mathrm{R}=$ TBS) in a number of solvents, reaction temperature and reaction media, with and without Lewis acids catalysis including inter alia $\mathrm{Et}_{2} \mathrm{AlCl}_{2}, \mathrm{TiCl}_{4}$ and $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$. However all reactions were unsuccessful and the lactam starting material was recovered. The lack of reactivity was attributed to steric effects of the bulky tosyl and TBS groups; thus a series of reactions involving $N$-acetyl- 1 H -pyrrol-2(5H)-one and the same diene were tested, but were also unsuccessful and the route was abandoned. ${ }^{29}$

From the studies of the reaction of various dienes with menthyloxy-furanone 197, ${ }^{70}$ it was evident that the steric bulk of 2-(tert-butyldimethylsilyloxy)-1,3-butadiene greatly hindered the reaction, even with a dienophile which is more activated than N -tosyl 1 H -pyrrol-2(5H)-one (239). It was envisaged that use of a less sterically demanding diene
would be able to increase the reactivity and provide the required Diels-Alder adduct 238.

### 3.2.1. Preparation of $\underline{N}$-tosyl- $\underline{H}-\mathrm{pyrrol}-2(5 \underline{H})$-one

Work began using the procedure outlined by Nandra ${ }^{29}$ to produce the pyrrol-( 5 H )-one 241 from pyrrolidinone 240. Initial $N$-tosyl protection occurred in good yields with purification by flash chromatography ( $86 \%$ ), and was optimised for larger scale preparations by using only recrystallisation from ethyl acetate to remove excess $p \mathrm{TsCl}$ and provide the pure product in $83 \%$ yield (Scheme 77). Nandra reported a modest $57 \%$ yield to generate 242 by selenylation $\alpha$ - to the carbonyl with LiHMDS followed by $\mathrm{PhSeBr} .{ }^{29}$ Modifying this procedure, by quenching with 1 M HCl , rather than saturated $\mathrm{NH}_{4} \mathrm{Cl}$, effected selenylation with a vastly improved yield of $98 \%$. Subsequent oxidation with $\mathrm{H}_{2} \mathrm{O}_{2}$ furnished the elimination product 239 in $83 \%$ yield. It was also possible to carry out the oxidation without purification of the intermediate selenyl product with no appreciable change in the overall yield.

Scheme 77: Preparation of N -tosyl-1 H -pyrrol-2(5H)-one

As PhSeBr is rather expensive ( $£ 92$ for 25 g , Alfa Aesar) and the selenide is only a transient functionality in this route, an alternative cheaper route was sought. Bromination with NBS, followed by dehydrobromination to the elimination product would result in the same overall transformation. A number of procedures was used for the initial bromination step, and are listed in Table 6.

With a procedure based upon that employed by Otaka, ${ }^{89}$ the protected lactam 241 was treated with LiHMDS and 1.2 equivalents of NBS, followed by workup with 1 M $\mathrm{NaHSO}_{3}$ to provide bromide 243 in $63 \%$ yield (entry 1). Use of LDA rather than LiHMDS led to incomplete reaction, and extended reaction times led to significant decomposition. Changing the quenching reagent to sodium sulfite led to greatly
decreased yields (entry 3), whereas the use of ammonium chloride gave the desired product in $82 \%$ yield.

Table 6: $\alpha$-Bromination of $N$-tosyl-pyrrolidinone with NBS (1.2 eq.) to give 243

| Entry | Base | Eq. | Workup | Yield / \% |
| :---: | :---: | :---: | :---: | :---: |
| 1 | LiHMDS, THF | 2.0 | $1 \mathrm{M} \mathrm{NaHSO}_{3}$ | 63 |
| 2 | LDA, THF | 2.0 | $1 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{3}$ | 20 |
| 3 | LiHMDS, THF | 2.0 | $1 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{3}$ | $2-25$ |
| 4 | LiHMDS, THF | 2.0 | Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ | 82 |
| 5 | LiHMDS, THF | 1.1 | Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ | $65^{\text {a }}$ |
| 6 | Amberlyst-15, EtOAc | $0.75 \mathrm{~g} / \mathrm{mmol}$ | Saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ | $0^{\mathrm{b}}$ |
| 3,3-Dibromo- $N$-tosyl-pyrrolidin-2-one isolated (7\%); starting material recovered |  |  |  |  |

The reactions were carried out using two equivalents of base with the assumption that the reaction would be otherwise incomplete, as the remaining $\alpha$-hydrogen to the carbonyl in product $\mathbf{2 4 3}$ is more acidic than those in starting material 241, and would hence be more favourably deprotonated. To verify this, 1.1 equivalents of LiHMDS was used and as expected, the reaction remained incomplete and provided only $65 \%$ of the desired product (entry 5). Surprisingly, a small amount of the dibrominated product was also isolated, a result that was not observed with two equivalents of base.

Meshram has recently developed a facile method to effect 2-halogenation of 1,3ketoesters and cyclic ketones using $N$-halosuccinimides and Amberlyst- $15^{\circledast},{ }^{90}$ but these conditions were unsuccessful with our substrate, presumably because the amide is less readily enolisable (entry 6).

A variety of methods were investigated for dehydrobromination of $\mathbf{2 4 3}$ to give $\mathbf{2 3 9}$, with little success. The best results were obtained with either a combination of LiBr and
$\mathrm{Li}_{2} \mathrm{CO}_{3},{ }^{91}$ or with $\mathrm{CaCO}_{3},{ }^{92}$ both in DMF at reflux, but a yield of no greater than $33 \%$ was obtained in either case.

At this point, as the selenylation route had been optimised, further work on bromination-dehydrobromination was ceased.

### 3.2.2. Uncatalysed Diels-Alder reactions

Preliminary investigations into the Diels-Alder reaction of enamide 239 were carried out under microwave irradiation without Corey's catalyst and the results are summarised in Table 7. It was initially pleasing to find that reaction between N -tosyl$1 H$-pyrrol-2(5H)-one 239 and methoxy diene 202 occurred without catalysis under microwave irradiation, albeit slowly and remaining largely incomplete at $150^{\circ} \mathrm{C}$ (entry 1). With this in mind, the temperature was raised to $180^{\circ} \mathrm{C}$ (entries 2 and 3 ) and indeed after 2 h , no starting material remained. However, near total isomerisation of the double bond occurred, producing an inseparable mixture of the desired product 244 and its regioisomer 245, with yields not much higher than when carrying out the reaction at a lower temperature. Variation of reaction temperature, concentration and duration was carried out (entries 4-7). As is evident from the table, the yields and ratio of products were very inconsistent, and lowering the reaction temperature and reacting for prolonged periods did not necessarily improve the results.

Table 7: Diels-Alder reactions with 2-methoxy-1,3-butadiene (3 eq.)

| Entry | Conditions $^{\mathbf{a , b}}$ | Conc $^{\mathbf{~}}$ <br> $/ \mathbf{M}$ | Temp. <br> $/{ }^{\circ} \mathbf{C}$ | Time <br> $/ \mathbf{h}$ | Ratio of <br> $\mathbf{2 4 4} \mathbf{2 4 5}$ | Combined <br> yield $/ \%$ |

| 16 | DCM | 0.2 | 80 | 2 | - | $0^{\text {d }}$ |

${ }^{\text {a }}$ Unless otherwise stated, reactions were carried out under microwave irradiation; ${ }^{\text {b }}$ 'wash' indicates washing the reaction vessel with the stated reagent followed by rinsing with acetone and thoroughly drying before use; ${ }^{c}$ purified by flash chromatography using basic alumina (grade III); ${ }^{\text {d }}$ no reaction took place, starting material recovered

In an attempt to suppress the isomerisation, the reaction glassware was washed with base and/or base was added to the reaction mixture (entries 8-13). Unfortunately, the yields were significantly reduced and moreover, little effect was observed on the ratio of products. To minimise the risk of isomerisation during purification by chromatography on silica gel, basic alumina was used; although the results suggest that this improved the regioisomeric ratio (entries 13-14), the yield was significantly lower, possibly due to the decrease in concentration of the reaction. Carrying out the reaction in a non-microwave
irradiated sealed tube also produced poor results (entry 15), as did changing to a more volatile solvent, where no reaction took place (entry 16).

### 3.2.3. Oxidative cleavage of Diels-Alder adduct

Even though the reproducibility in the synthesis of desired Diels-Alder adduct $\mathbf{2 4 4}$ was difficult, it was desirable to ascertain whether there were going to be problems at the oxidative cleavage step as previously discussed. The two regioisomers 244 and $\mathbf{2 4 5}$, obtained from reactions where only a single regioisomer was produced (entries 3 and 6), were separately treated with ozone followed by workup with DMS (Scheme 78). In contrast to the results for the corresponding furanone substrates, the crude products of these ozonolyses were often very clean. However, the desired aldehyde product 246 appeared to decompose or was retained on silica as it was isolated in only a $38 \%$ yield. Aldehyde $\mathbf{2 4 7}$ was obtained from the isomerised enol ether $\mathbf{2 4 5}$ in $\mathbf{6 0 \%}$ yield. As the oxidative cleavage step did not pose a big problem, it was felt that if the Diels-Alder reaction could be optimised, the ozonolysed products could be separated by flash chromatography at the next step.

Scheme 78: Oxidative cleavage of Diels-Alder adducts

To ascertain whether the problems with isomerisation of the Diels-Alder adducts could be made irrelevant by nitrosation of the equivalent ketone substrate, the trimethylsilyloxy enol ether adduct 248 was prepared and was then desilylated by purification by flash chromatography on silica gel to provide ketone 249 (Scheme 79). Treatment of $\mathbf{2 4 8}$ or the ketone variant, $\mathbf{2 4 9}$, with AmONO and TMSCl unfortunately led to incomplete reaction and produced a complex mixture of products.

Scheme 79

### 3.2.4. Asymmetric Diels-Alder reaction with Corey's catalyst

Despite the isomerisation troubles encountered with the uncatalysed Diels-Alder reactions, it was thought that the problem might be overcome when the reaction was carried out in the presence of the aforementioned Corey oxazaborolidine catalysts, as lower temperatures would be used.

### 3.2.4.1. Preparation of the oxazaborolidine catalyst

The oxazaborolidine derived from (S)- $\alpha, \alpha$-di(3,5-dimethylphenyl)-2pyrrolidinemethanol (253) was selected to be used as the catalyst in this Diels-Alder reaction, as published results showed that it generally gave better yields and enantioselectivity than the diphenyl equivalent. ${ }^{85-88}$ The ( $S$ )-catalyst was selected due to its lower cost, even though it would provide the adduct with the wrong stereochemistry for the total synthesis.

Using a procedure of Mathre, ${ }^{93,94}(S)$-proline was treated with triphosgene followed by base to initiate cyclisation to form anhydride $\mathbf{2 5 0}$, which was immediately treated with Grignard reagent 251, prepared from 5-bromo-m-xylene (Scheme 80). The Grignard reagent could theoretically attack either carbonyl of the anhydride and thus the major by-products of this reaction are (S)-N-(3,5-dimethylbenzoyl)proline, 3,3',5,5'-
tetramethylbenzophenone and tri(3,5-dimethylphenyl)methanol. Mathre developed a very convenient workup procedure for removal of these impurities by formation of the prolinol sulfate salt then simply washing with water and ethyl acetate to afford pure 252 in $55 \%$ yield. Treatment with NaOH provided the free prolinol 253 in quantitative yield which was further purified by recrystallisation.

Scheme 80: Preparation of prolinol 253

To synthesise the boroxine component, benzene was distilled from $o$-tolylboronic acid to furnish the dehydrated boroxine $\mathbf{2 5 4}$ in quantitative yield (Scheme 81). ${ }^{85}$ Completion of the oxazaborolidine synthesis involved refluxing a solution of boroxine 254 and prolinol 253 in toluene over molecular sieves to furnish $\mathbf{2 5 5}$. This product was used immediately in the Diels-Alder reactions.

Scheme 81: Synthesis of oxazaborolidine 255

### 3.2.4.2. Catalysed Diels-Alder reaction

Corey reported that the use of the oxazaborolidine $\mathbf{2 5 5}$ with triflic acid in the DielsAlder reaction required the temperature of the reaction to be kept below $0^{\circ} \mathrm{C}$, otherwise the Lewis acid suffered from decomposition. ${ }^{87}$ Unfortunately the lactam dienophile 239
was insoluble in DCM at low temperatures and therefore the reactions had to be carried out at high dilutions. It was difficult to sustain the solubility of $\mathbf{2 3 9}$ during the reaction and it often precipitated out. Reactions with the methoxy- and trimethylsilyloxy dienes, starting at $-95^{\circ} \mathrm{C}$ and gradually warming up to $-10^{\circ} \mathrm{C}$ over a number of days were unsuccessful, and the lactam dienophile was recovered (Scheme 82). The lack of reaction was attributed to the low temperature of the reaction.

Scheme 82: Diels-Alder reaction with oxazaborolidine and triflic acid

Corey has discovered that it was possible to warm the reaction to room temperature if triflic acid was replaced with triflimide, with the added advantage of successfully catalysing reactions between a number of substrates that failed when using triflic acid. ${ }^{87}$ Repeating these conditions with our substrates began at $-78^{\circ} \mathrm{C}$, then warming to room temperature, stirring for several days. Although the substrates were soluble, no reaction took place with the methoxy-diene, and with the trimethylsilyloxy-diene there appeared to be only a trace signal in the region of the ${ }^{1} \mathrm{H}$ NMR spectra compatible with the DielsAlder adducts.

In addition, the simple furanone 228, a dienophile which was used in Corey's studies, was treated with the methoxy-diene in the presence of Corey's catalyst and triflimide. Although the furanone starting material was consumed within a few hours, the reaction yielded a complex mixture of products, and comparison of its crude ${ }^{1} \mathrm{H}$ NMR spectrum to that of the authentic product (229) from the uncatalysed reaction (section 3.1.6.3) showed absence of the desired product.

### 3.2.5. Isoprene as diene

To conclude the investigation into using $N$-tosyl-1 H -pyrrol-2(5H)-one as dienophile, it was reacted with isoprene and various Lewis acids (Table 8). Low conversion was achieved with absence of Lewis acid, but a favourable ratio of the desired "pseudo-
para" regioisomer 256a over 256b was obtained with $\mathrm{AlCl}_{3}{ }^{73}$ in refluxing DCM. Unfortunately ozonolysis of these adducts led to an inseparable mixture of cleaved products in moderate yields.

Table 8: Diels-Alder reaction with isoprene (10 eq.)

| Entry | Conditions | Yield / \% |
| :---: | :---: | :---: |
| 1 | Microwave, toluene, $130{ }^{\circ} \mathrm{C}, 2 \mathrm{~h}$ | $20^{\mathrm{a}, \mathrm{b}}$ |
| 2 | Microwave, $\mathrm{AlCl}_{3}$, toluene, $130^{\circ} \mathrm{C}, 1 \mathrm{~h}$ | $43^{\mathrm{b}}$ |
| 3 | $\mathrm{AlCl}_{3}, \mathrm{DCM}, 50^{\circ} \mathrm{C}$ | $78^{\mathrm{c}}$ |
| 4 | $\mathrm{EtAlCl}_{2}, \mathrm{ZnCl}_{2}, \mathrm{DCM}, \mathrm{rt}$ | $0^{\mathrm{d}}$ |
| $30 \%$ conversion; ${ }^{\mathrm{b}}$ ratio of isomers not determined; ${ }^{\mathrm{c}}$ ratio of 256a:256b 3:1; |  |  |
| ${ }^{\mathrm{d}}$ starting material recovered |  |  |

Due to the unpredictability of the reaction rates and problems of isomerisation, development with this Diels-Alder route was ceased.

### 3.3. Strategy three - Michael addition of $N$-benzylpyrrolidin-2-one

Heathcock and co-workers have published a report detailing studies into the regio- and diastereoselectivity of the addition of amide and thioamide enolates to $\alpha, \beta$-unsaturated ketones; these reactions were found to be affected by the nature of enone, enolate, enolate counterion and solvent. ${ }^{95}$ The selective formation of either the syn or anti addition products by varying solvents and counterion was also demonstrated. As part of these studies, the enolate of $N$-methylpyrrolidin-2-one was treated with a variety of $\alpha, \beta$ unsaturated ketones. In the example shown in Scheme 83, syn adduct 257a was produced in preference to anti adduct $\mathbf{2 5 7 b}$ in a ratio of $9: 1$; the reaction was also selective for 1,4-addition over 1,2-addition by 97:3.

Scheme 83: Michael addition of $N$-methylpyrrolidin-2-one

The synthesis of 258, a key intermediate in our synthesis of the sarain core, was next investigated via such a Michael addition. $N$-Benzylpyrrolidin-2-one and protected (E)-5-hydroxypent-3-en-2-one $\mathbf{2 5 9}$ were selected as suitable starting materials (Scheme 84); however, there were no examples of Michael additions onto $\gamma$-oxygenated- $\alpha, \beta$ unsaturated ketones within Heathcock's report.

Scheme 84: Retrosynthetic route to lactam 258 via Michael addition

### 3.3.1. Preparation of Michael acceptor

A preparation of the alcohol corresponding to $\mathbf{2 5 9}$ has been reported in the literature, ${ }^{96}$ but purification is known to be difficult and moreover, the compound is unstable to basic conditions. Under such conditions, it undergoes an oxa-Michael/Michael dimerisation to tetrahydrofuran 260, followed by an intramolecular aldol condensation to fused bicycle 261 (Scheme 85). The protection of the hydroxy group was therefore carried out early in the synthesis.

Scheme 85: Reactions of ( $\boldsymbol{E}$ )-5-hydroxypent-3-en-2-one with base

A literature procedure for the preparation of the Michael acceptor 259 involves a Horner-Wadsworth-Emmons reaction of phosphonate 262 and aldehyde 263 (Scheme 86); ${ }^{97}$ our investigation into the Michael addition strategy began with the synthesis of these two fragments.

Scheme 86: Preparation of Michael acceptor 259

Phosphonate 262 was prepared in moderate yields by an Arbuzov reaction of chloroacetone with triethyl phosphite (Scheme 87). ${ }^{98}$ The preparation of the aldehyde fragment from allyl alcohol was more problematic due to the volatility of the intermediate allyl tert-butyldimethylsilyl ether (264). The problems associated with this method led to the development of another route to the enone.

Scheme 87: Synthesis of fragments for Horner-Wadsworth-Emmons reaction

Monoprotection of (Z)-butene-1,4-diol with tert-butyldimethylsilyl chloride afforded alcohol 266 in good yield, but although a large excess of the diol was used, a small amount of the doubly protected alcohol 265 was also isolated (Scheme 88). Turning this to our advantage, it was anticipated that treatment of this by-product with ozone would create two equivalent of the aldehyde 263 for the Horner-Wadsworth-Emmons route. But instead, a compound with NMR and mass spectrometric properties which were consistent with the aldehyde in its trimeric form (267) was produced.

Scheme 88

Reverting to the previous route, the mono-protected alcohol 266 was treated with PCC to effect both oxidation and isomerisation of the double bond to provide the desired $(E)$ $\alpha, \beta$-enal 268, which following addition of methyllithium and subsequent oxidation furnished the desired methyl ketone 259 in moderate yields (Scheme 89). Only a small amount of impurities was observed in the crude products, and it is assumed that the low isolated yields were due to the decomposition of the allylic silyl ethers during purification by silica gel chromatography. The sequence from monoprotected alcohol 266 to methyl ketone 259 was therefore repeated without purification of any intermediates, and furnished the product in an improved $29 \%$ overall yield.

Scheme 89: Multistep preparation of Michael acceptor

Although the yields for this route were far from ideal, sufficient quantities of $(E)-5-$ (tert-butyldimethylsilyloxy)-pent-3-en-2-one (259) were generated for a preliminary investigation into the efficiency of the Michael reaction to produce desired adduct (cf. 258).

### 3.3.2. Michael addition

$N$-Benzylpyrrolidin-2-one was treated sequentially with LDA then the enone at $-78^{\circ} \mathrm{C}$, followed by warming to room temperature. The addition reaction appeared very slow and therefore this mixture was subsequently heated to $60{ }^{\circ} \mathrm{C}$. The partially purified major product from this reaction was only isolated in very small quantities and the ${ }^{1} \mathrm{H}$ NMR spectrum of this material contained a large number of peaks in the alkene region which did not appear to correspond to the enone or the 1,2-Michael product. Heathcock's paper suggested that the use of thioamide rather than oxoamide enolates increases the likelihood of 1,4-conjugate addition as the enethiolate is a softer nucleophile. Analogous conditions were therefore applied to N -benzylpyrrolidin-2thione but unfortunately the reaction was again very slow, and heating the reaction mixture for prolonged periods led to decomposition of the enone, while the thioamide was recovered unreacted (Scheme 90).

Scheme 90
These poor results together with the difficulties in the preparation of the enone, and the uncertainty as to whether good regio- or diastereoselectivity would be achieved led to abandonment of this route.

### 3.4. Strategy four: Thio-Claisen rearrangement

### 3.4.1. Previous work

One of the more promising routes previously developed within the group to synthesise bicyclic aminals involves a Claisen rearrangement. Reaction of $N$-benzylpyrrolidin-2one with dimethyl sulfate generated a methoxymethyleniminium methyl sulfate salt. Heating this salt with the lithium alkoxide of alcohol 270 led to formation of a $\mathrm{N}, \mathrm{O}$ ketene acetal, ${ }^{99}$ which underwent a $[3,3]$-sigmatropic rearrangement to give 271 in a somewhat modest yield of 33-56\% (Scheme 91). ${ }^{30}$

Scheme 91

The success of the Claisen rearrangement in generating 271 was promising despite the modest yield, and led to examination of alternative processes, including thio-Claisen rearrangement. This is advantageous as the nucleophilicity of the sulfur allows direct alkylation with an allylic bromide, without the prior need for formation of the iminium salt. Thus lactam 272 was first converted into the corresponding thiolactam 273 in good yield by treatment with $\mathrm{P}_{4} \mathrm{~S}_{10}$ (Scheme 92). Conditions were developed for the thioClaisen rearrangement to take place with excellent diastereoselectivity, which consisted of first stirring a concentrated solution of the thiolactam with bromide 274 in MeCN to form the salt $\mathbf{2 7 5}$, followed by dilution with further MeCN , heating to $40^{\circ} \mathrm{C}$, and then addition of $\mathrm{Et}_{3} \mathrm{~N} .{ }^{100}$ This produced the desired product $\mathbf{2 7 6}$ in $>50: 1$ diastereoselectivity, and an X-ray structural analysis of the p-nitrobenzoate derivative of the alcohol confirmed the relative stereochemistry of the compound to be as drawn in 276, which is consistent with the reaction proceeding via a chair transition state. ${ }^{100}$

Scheme 92
Thiolactam 276 was then hydrolysed to the corresponding lactam, and mesylation of the alcohol followed by its displacement provided azide 277, which was converted to
bicycle 278, through the reductive cyclisation protocol described in section 1.3.6.1 (Scheme 93).

Scheme 93

Unfortunately, exposure of the bicyclic aminal 278 to even mildly acidic conditions, such as silica gel, caused isomerisation to give a mixture of isomers 278 and 278a. Whilst purification of aminal 278 was possible by chromatography on alumina, retaining stereochemical purity whilst introducing further functionalisation was difficult.

It is believed that the mechanism of the isomerisation follows the pathway depicted in Scheme 94. Protonation of either amine could cause ring opening of the bicyclic aminal, and subsequent loss of a proton would lead to enamine 279. This species could reprotonate from either face, and therefore leads to a mixture of stereoisomers 278 and 278a. ${ }^{101}$

278

278a

Scheme 94: Proposed mechanism of ring isomerisation

### 3.4.2. Synthesis of a bicyclic aminal bearing a methyl group

It was decided that the successful preliminary work described above could be continued by replacing the hydrogen at the ring junction with a 'blocking group' so that enamine formation, and hence the stereoisomerisation process, is prevented. An ideal blocking group would be one that can be removed at the end of the synthesis, but a simple methyl group was chosen to provide a simple 'proof of concept' model.

The methyl group was incorporated into the substrate at the start of the synthesis. Alkylation of $N$-benzylpyrrolidinone by treatment with $n$-BuLi followed by MeI provided the desired product 280 in excellent yields. Unfortunately, the subsequent synthesis of the bicyclic aminal was not as straightforward as hoped. Although the sequence of reactions was essentially the same as before, several of the procedures previously developed needed to be modified for the methylated substrates.

Scheme 95

Thionation of lactam 280 under the previously used conditions of $\mathrm{P}_{4} \mathrm{~S}_{10}$ with $\mathrm{Na}_{2} \mathrm{CO}_{3}{ }^{102}$ in THF at ambient temperature resulted in an incomplete reaction even after a prolonged period of time, with $28 \%$ starting material being recovered, and the product being isolated in only $55 \%$ yield (Table 9, entry 1). Although better yields were obtained with $\mathrm{P}_{4} \mathrm{~S}_{10}$ at higher temperatures, they were inferior to those obtained with Lawesson's reagent, ${ }^{103}$ which furnished thiolactam 281 in excellent yield.

Table 9: Thionation of $\boldsymbol{N}$-benzyl-3-methyl-pyrrolidin-2-one

| Entry | Conditions | Time /h | Yield / \% |
| :---: | :---: | :---: | :---: |
| 1 | $\mathrm{P}_{4} \mathrm{~S}_{10}, \mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{THF}, \mathrm{rt}$ | 40 | 55 |
| 2 | $\mathrm{P}_{4} \mathrm{~S}_{10}, \mathrm{THF}, 40^{\circ} \mathrm{C}$ | 5 | 70 |
| 3 | $\mathrm{P}_{4} \mathrm{~S}_{10}, \mathrm{DCM}, 50^{\circ} \mathrm{C}$ | 20 | 86 |
| 4 | Lawesson's reagent, THF, $40^{\circ} \mathrm{C}$ | 2 | 91 |

Bromide 274 was freshly prepared by DIBAH reduction of methyl 4-bromocrotonate (Scheme 96). ${ }^{104}$ However, if bromide 274 was used crude (as was the case for the nonmethylated route) the thio-Claisen rearrangement took place in highly inconsistent and low yields, with decomposition of starting material. In addition, when the salt formation step was carried out at a concentration of 0.5 M in MeCN , thiolactam 281 remained largely unreacted. The optimal conditions were to perform the salt formation at a concentration of $\sim 6 \mathrm{M}$, using purified bromide $\mathbf{2 7 4}$; following dilution to 0.2 M and treatment with $\mathrm{Et}_{3} \mathrm{~N}$, this routinely provided the desired product 282 in $75 \%$ yield, with $3 \%$ recovered starting material. There was no evidence of formation of the undesired stereoisomer.

Scheme 96

Hydrolysis of the thiolactam 282 by treatment with MeI and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in a THF/ $\mathrm{H}_{2} \mathrm{O}$ mix ${ }^{105}$ was very slow and inconsistent. The best result was obtained after 14 days of reaction, with incomplete conversion, providing the product $\mathbf{2 8 3}$ in $\mathbf{7 2 \%}$ yield, and also $14 \%$ of iodide product 284 (Scheme 97).

Scheme 97

The mechanism of this hydrolysis is assumed to begin with methylation of the thiolactam; the resulting salt $\mathbf{2 8 5}$ could be attacked by $\mathrm{H}_{2} \mathrm{O}$ to give product $\mathbf{2 8 3}$, or by the internal hydroxyl group, leading to formation of oxocarbenium ion 286 (Scheme 97). A nucleophilic attack by water would form the desired product 283, but attack from iodide would yield product 284. It was thought that iodoalkane 284 could be useful in that the iodide could be directly displaced with $\mathrm{NaN}_{3}$ (rather than requiring activation, like alcohol 283). When the reaction was carried out, it afforded an inseparable mixture of the olefinic elimination product 287 and desired azide 288, with the undesired olefin 287 present as the major component (Scheme 98).

Scheme 98

Other methods for the hydrolysis of thiolactam 282 were tried, including reaction with dimethyldioxirane, generated in situ by use of oxone and $\mathrm{NaHCO}_{3},{ }^{106}$ but this gave 283 in only $17 \%$ yield, with decomposition of starting material. The best method involved treatment with $m$ CPBA in DCM, ${ }^{107}$ which in 2 h provided the desired product 283 in 93\% yield (Scheme 99). Slow, portionwise addition of the reagent was required to prevent any oxidation of the double bond.

Mesylation of alcohol $\mathbf{2 8 3}$ and subsequent azide displacement took place uneventfully; mesylate $\mathbf{2 8 9}$ could be isolated in $94 \%$ yield, but was routinely used without purification in the next reaction to provide azide 288 in $87 \%$ yield over 2 steps. Initial attempts at carrying out the reductive cyclisation step using published conditions of 1.2 equivalents of $\mathrm{PBu}_{3}$ and 0.6 equivalents of $\mathrm{LiAlH}_{4}{ }^{30}$ often returned the simple azide reduction material 290 as the major product (50\%, with $25 \%$ desired product 291). Attempts to convert this simple amide into the desired product by addition of $\mathrm{LiAlH}_{4}$ in a subsequent step were unsuccessful, returning a polar compound, thought to be the pyrrolidine derived from reduction of the pyrrolidinone moiety. Optimal conditions for the reductive cyclisation procedure consisted of using 1.8 equivalents of $\mathrm{PBu}_{3}$ followed by two equivalents of $\mathrm{LiAlH}_{4}$ in two batches, one hour apart. Under these conditions, bicyclic aminal 291 was routinely obtained in yields of $>70 \%$. As predicted, the additional methyl group proved to be effective in preventing the stereoisomerisation process, and it was possible to purify this and subsequent bicyclic aminal products by chromatography on silica gel.

Scheme 99

The next step was to protect the secondary amine in 291 with an electron withdrawing group. A sulfonamide was chosen and a number of protection conditions were explored (Table 10).

Table 10: Tosylation of amine

| Entry | Reagents | Time | Yield / \% |
| :---: | :---: | :---: | :---: |
| 1 | TsCl, DIPEA, DCM | 5 d | 62 |
| 2 | TsCl, DIPEA, DMAP, DCM | 4 d | 65 |
| 3 | ${ }^{\mathrm{n}}$ BuLi, TsCl, THF | 2 h | 47 |
| 4 | TsCl, pyridine | 16 h | 87 |

On using DIPEA, the reaction was slow in the absence or presence of catalytic DMAP (Table 10), while the use of ${ }^{\mathrm{n}} \mathrm{BuLi}$ as base gave only moderate yields. The best conditions were to use pyridine as the solvent in the reaction, which furnished the sulfonamide 292 in $87 \%$ yield.

### 3.4.3. Functionalisation of the olefin into a carboxylic acid

With the bicyclic aminal finally synthesised, the next task in hand was to convert the terminal olefin in 292 into a carboxylic acid, for transformation into a diazoketone. For such, a hydroboration-oxidation strategy to synthesise the primary alcohol was adopted. Whilst use of $\mathrm{BH}_{3}$.THF and 9-BBN failed, hydroboration with pinacolborane in the presence of Wilkinson's catalyst ${ }^{108}$ in THF was successful (Table 11).

Table 11: Hydroboration of olefin product 292

| Entry | Conditions | Result |
| :---: | :---: | :---: |
| 1 | $9-B B N$ | No reaction |
| 2 | $\mathrm{BH}_{3} . \mathrm{THF}$ | Decomposition |
| 3 | Pinacolborane, Wilkinson's catalyst, DCM, 5 d | $3 \%, 43 \%$ SM |
| 4 | Pinacolborane, Wilkinson's catalyst, THF, 24 h | $72 \%$ |

Scheme 100

The boronate 293 could be isolated first before oxidation to give the desired alcohol product 294 (Scheme 100), but it was more convenient to carry out the oxidation in the same pot by addition of NaOH and $\mathrm{H}_{2} \mathrm{O}_{2}$ after consumption of starting material. However, with the Wilkinson's catalyst remaining in the reaction mixture, the $\mathrm{H}_{2} \mathrm{O}_{2}$ was partially decomposed into $\mathrm{O}_{2}$ and it was difficult to prevent sudden foaming of the reaction mixture. Despite these problems, alcohol 294 was isolated in $70 \%$ overall yield. The decomposition of $\mathrm{H}_{2} \mathrm{O}_{2}$ could be circumvented by use of the milder water/sodium perborate ${ }^{109}$ combination for the oxidative step.

Scheme 101

When the reaction was carried out on a larger scale, a significant amount of a side product was consistently produced from the hydroboration step, and this material was inert to the oxidative agents. This was identified to be the simple reduction product 295 and was isolated in yields of up to $27 \%$ (Scheme 101). This observation is in keeping with a detailed study into the analogous reactions of catecholborane with Wilkinson's catalyst, in which reaction with 2-ethylbut-1-ene resulted in not only formation of the desired boronate ester 296 in $85 \%$ yield, but also 3-methylpentane as the hydrogenation product in $15 \%$ yield. ${ }^{110}$

296
Scheme 102

The mechanism proposed for the hydroboration of alkenes mediated by Wilkinson's catalyst involves oxidative addition of the $\mathrm{B}-\mathrm{H}$ bond to Rh , followed by alkene insertion and reductive elimination to furnish the observed product 296 (Scheme 102). ${ }^{110}$ In the absence of the alkene substrate, there was appreciable degradation of catecholborane from reaction with the catalyst to give a number of different products (Scheme 103). ${ }^{110}$ A by-product of particular relevance is dihydride complex 297, a catalyst precursor for hydrogenation reactions, and as hydrogen is also a degradation product, this could explain the formation of simple alkene reduction products.

Scheme 103

In addition, $\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}$ is susceptible to oxidation, especially when the catalyst is in solution. Significantly, this oxidised catalyst is reported to be a more active catalyst for alkene hydrogenation. ${ }^{111}$ In light of this, hydroboration of alkene 292 was carried out by first thoroughly degassing the reaction mixture, before maintaining the reaction strictly under an inert atmosphere of argon. This, in combination with use of sodium perborate as the oxidant, led to isolation of the desired product $\mathbf{2 9 4}$ in $86 \%$ yield, and the reduced product 295 in only $7 \%$ yield.

Attempts to oxidise the primary alcohol 294 to a carboxylic acid directly proved ineffective with either oxone/2-iodobenzoic acid ${ }^{112}$ or a $\mathrm{NaOCl} / \mathrm{TEMPO}^{113}$ combination. Use of the strong ruthenium tetroxide oxidant ${ }^{114}$ (from either $\mathrm{RuCl}_{3}$ or $\mathrm{RuO}_{2}$ with $\mathrm{NaIO}_{4}$ ) was unselective, as it not only oxidised the primary alcohol, but also led to the disappearance of the $\mathrm{BnNCH}_{2}$ proton signals in the ${ }^{1} \mathrm{H}$ NMR spectrum, suggesting that this activated position adjacent to the amine was also simultaneously oxidised to give a lactam.

A two step oxidation protocol, via aldehyde 298, was thus adopted. Subjecting alcohol 294 to Swern oxidation conditions led to recovery of starting material 294, whilst variable and modest yields were obtained using TPAP/NMO (Table 12). ${ }^{115,116}$ Initially, similar results were obtained with Dess-Martin Periodinane, but more reliable reactions and greater yields were obtained by carrying out the oxidation using freshly prepared Dess-Martin Periodinane ${ }^{117}$ in the presence of pyridine.

Table 12: Oxidation of alcohol to aldehyde

| Entry | Conditions | Yield |
| :---: | :---: | :---: |
| 1 | $(\mathrm{COCl})_{2}, \mathrm{DMSO}^{2} \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}$ | No reaction |
| 2 | TPAP, NMO, DCM | $28-42 \%$ |
| 3 | TPAP, NMO, MeCN | $35-60 \%$ |
| 4 | DMP, pyridine, DCM | $80 \%$ |

Aldehyde 298 was subsequently oxidised to carboxylic acid 299 using Pinnick's conditions (Scheme 104). ${ }^{118}$ The product was isolated in good yields by carrying out the workup at pH 6 , and this could be exploited to further purify the compound by a simple acid/base wash.

Scheme 104

The synthesis of carboxylic acid 299 represents the accomplishment of a major milestone in our studies. With this in hand, attention turned to converting it into a diazoketone to test the novel carbene ammonium ylide rearrangement strategy as a viable route towards the sarain core.

### 3.5. Synthesis of diazo compounds

### 3.5.1. Conversion of carboxylic acid into a diazoketone

The transformation of carboxylic acid $\mathbf{2 9 9}$ to diazoketone $\mathbf{3 0 0}$ was expected to be relatively straightforward, involving first activation of carboxylic acid 299, then treatment with a diazomethane derivative, such as $\mathrm{TMSCHN}_{2}$ (Scheme 105). ${ }^{119}$

Scheme 105

Diazoketones are typically synthesised from carboxylic acids by activation to an acid chloride or a mixed anhydride intermediate. However, the use of $(\mathrm{COCl})_{2} / \mathrm{DMF}$, ${ }^{i} \mathrm{BuOCOCl} / \mathrm{Et}_{3} \mathrm{~N}$ or $\mathrm{EtOCOCl} / \mathrm{Et}_{3} \mathrm{~N}$ on carboxylic acid 299 consistently led to the starting material being consumed to give a polar compound which was unreactive to $\mathrm{TMSCHN}_{2}$. Using extensive NMR spectroscopy, this compound was subsequently identified as lactam 301, which was produced in yields of up to $62 \%$ (Scheme 106). One rationale for its formation is that the HCl produced on activation of the acid protonates the more nucleophilic benzylamine (302), leading to ring opening to provide secondary amine 303, which cyclises onto the activated carbonyl group to give the seven-
membered lactam. Hydration of the tosyliminium ion then completes the generation of observed product 301.

Scheme 106

In this proposed mechanism, the initial step involves protonation of the benzylamine nitrogen (i.e. 302). This is assumed to be favoured over direct acylation of the tertiary amine, as the resulting tricycle would be under considerable ring strain. Had protonation taken place at the sulfonamide, with subsequent cleavage of the C-NTs bond, then it is conceivable that an alternative lactam adduct, 301a, could be produced. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{3 0 1}$ and 301a should be very similar, but evidence for formation of the former was observed in the HMBC spectra, where there is clearly a long range coupling between the carbonyl carbon and the benzylic protons, which is only possible in product 301 (Scheme 107).

Although the formation of $\mathbf{3 0 1}$ is an undesired result, it was encouraging to see that the bicyclic ring system is capable of undergoing a facile ring-opening-cyclisation sequence. Similarities can be drawn with our proposed strategy, in which the X group in 302 would be a metal carbene, and would be expected to first form an ammonium ylide with the benzylamine before ring opening to the tosyliminium ion (cf. 303). An intramolecular Mannich cyclisation of the enolate onto the iminium ion, rather than the hydration leading to product $\mathbf{3 0 1}$ would then give the desired sarain tricyclic core.

On the grounds that the acidity of the reaction may be a problem in the synthesis of diazoketone 300, basic additives were incorporated into the reaction: NaH was first used to pre-form the sodium salt of the carboxylic acid before addition of ${ }^{\mathrm{i}} \mathrm{BuOCOCl}$ so the by-product would be NaCl instead of HCl ; in another reaction, $\mathrm{NaHCO}_{3}$ and molecular sieves were also added, but again lactam $\mathbf{3 0 1}$ was formed. Conversely, addition of HCl in the activation stage was also investigated, as this could lead to complete protonation of the secondary amine $\mathbf{3 0 3}$, thus preventing cyclisation onto the activated acid. Unfortunately this led to decomposition of materials with the formation of a small amount of the undesired lactam 301.

Other reagents which do not produce acidic by-products were also investigated. Ghosez has reported the synthesis of acyl halides in excellent yields using 1-chloro- $N, N, 2$ trimethylpropenylamine as the activating agent. ${ }^{120} \mathrm{He}$ described that acids are almost instantaneously transformed into the acid chlorides; the by-product being the relatively inert $\mathrm{N}, \mathrm{N}$-dimethylisobutyramide and not HCl . As such, this method presents a synthesis of acyl halides under very mild conditions. However, the carboxylic acid starting material 299 remained largely unreacted when treated with Ghosez's reagent.

Other activating strategies that have also been used in the synthesis of diazoketones include formation of pentafluorophenyl- or N -hydroxysuccinimido- esters by DCC
coupling with pentafluorophenol ${ }^{121,122}$ or N -hydroxysuccinimide. ${ }^{123}$ Unfortunately, these protocols also produced lactam 301, a result which was attributed to the relative low $\mathrm{pK}_{\mathrm{a}}$ values of 5.2 and 5.9 respectively for both reagents. Rannard ${ }^{124}$ has reported that imidazolides, synthesised from the reaction of carboxylic acids with carbonyl diimidazole (CDI), react with primary amines preferentially, even exclusively in some cases, in the presence of secondary and tertiary amine functionalities. Although there are no reports of reaction of imidazolides to form diazoketones, similarities in their reaction properties can be drawn from its successful reaction with nitromethane in the presence of $\mathrm{KO}^{\mathrm{t}} \mathrm{Bu}^{125}$ The use of imidazolides was expected to suppress lactam formation, but when acid 299 was treated with CDI, the rearranged product 301 once again prevailed. This may have occurred before the formation of the imidazolide, using the initially formed electrophilic anhydride as an intermediate.

Markó has reported that acid bromides can be prepared directly from aldehydes from treatment with NBS and AIBN, ${ }^{126}$ but when this protocol was applied to aldehyde 298, only a complex mixture of products was obtained.

There were occasions when carboxylic acid 299 was not completely consumed in the activation stage, and thus upon addition of $\mathrm{TMSCHN}_{2}$, methyl ester $\mathbf{3 0 4}$ was produced, in yields of up to $50 \%$. There have been reports of successful ring opening of lactones ${ }^{127}$ and lactams, ${ }^{128}$ and also displacement of esters ${ }^{129}$ to form the corresponding diazoketones by treatment with $\operatorname{LiTMSCN}_{2}$, but when the procedure was applied to ester 304, only the starting material was recovered (Scheme 108).

Scheme 108

A search for alternative approaches to diazoketones returned a methodology developed by Aller and Molina, ${ }^{130}$ where aliphatic, aromatic and $\alpha, \beta$-unsaturated acid chlorides can be converted to diazoketones by treatment with N -isocyanotriphenyliminophosphorane
(305), followed by $\mathrm{Et}_{3} \mathrm{~N}$ and catalytic $p \mathrm{TsCl}$. The mechanistic pathway proposed by Aller and co-workers involves a chemoselective acylation at the isocyano group to provide intermediate 306, which after hydrolysis gives the isolable $\alpha$-ketohydrazidoyl chloride 307. Reaction with $\mathrm{Et}_{3} \mathrm{~N}$ and catalytic $p \mathrm{TsCl}$ results in tosylation of the terminal nitrogen, and elimination of $p \mathrm{TsCl}$ gives intermediate 308, and hence the diazoketone after hydrogen migration (Scheme 109).

Scheme 109

This reaction is described as a convenient synthesis of diazoketones as it uses a thermally stable, solid reagent, and has general applicability and chemoselectivity. ${ }^{130}$ It has also been shown to be successful in converting phenylacetyl chloride to the corresponding diazoketone in $99 \%$ yield, whereas the diazomethane method resulted in poor yields (<10\%).

It was thought that this method of synthesising diazoketones may be useful in relieving the problems of persistent formation of lactam $\mathbf{3 0 1}$ during activation of carboxylic acid 299. Our initial choice of reagent, $\mathrm{TMSCHN}_{2}$, could not be added at the beginning of the reaction, as the acid would no doubt react with $\mathrm{TMSCHN}_{2}$ to form the methyl ester 304. In contrast, the acid should be inert to $N$-isocyanotriphenyliminophosphorane 305, and consequently it could be included in the initial reaction mixture. The iminophosphorane 305 was thus prepared by treatment of formylhydrazine with $\mathrm{PPh}_{3}$ and DBU (Scheme 110). ${ }^{131}$ Unfortunately, inclusion of reagent $\mathbf{3 0 5}$ in the activation of carboxylic acid 299 by CDI, resulted in recovery of starting material 299, while its inclusion in the reaction of acid 299 with isobutyl chloroformate in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ gave an intractable mixture of products.

Scheme 110

### 3.5.2. Synthesis of a methyl ketone as a precursor to the diazoketone

There is another approach to diazoketones that does not start from a carboxylic acid, but rather from a methyl ketone. The ketone is first converted to a $\beta$-diketone, which is then subjected to diazo transfer. Deacylation, either concomitant with or subsequent to diazo transfer gives the desired diazomethyl ketone. In the approach developed by Danheiser, ${ }^{132}$ the methyl ketone is first converted to a trifluoroacetyl derivative, and diazo transfer occurs with concomitant fragmentation, generating the diazoketone (Scheme 111).

Scheme 111

Applying this methodology to the preparation of diazoketone 300, methyl ketone substrate $\mathbf{3 1 0}$ was prepared by a Grignard reaction with aldehyde $\mathbf{2 9 8}$ to give secondary alcohol $\mathbf{3 0 9}$ as a mixture of diastereoisomers, followed by an oxidation with DMP to afford the methyl ketone $\mathbf{3 1 0}$ (Scheme 112). Disappointingly, treatment with LiHMDS and trifluoroethyl trifluoroacetate resulted in the recovery of a large amount of starting material, with no evidence for formation of the desired product $\mathbf{3 1 1}$.

Scheme 112

### 3.5.3. A second diazoketone substrate

Due to problems in the synthesis of diazomethyl ketone 300, attention turned to synthesising an alternative diazoketone substrate, $\alpha$-diazo- $\beta$-keto-ester $\mathbf{3 1 4}$, which could be used to test the cascade proposal, but would ultimately lead to the sarain core with an additional ester functionality (315). Roskamp reported that it is possible to transform an aldehyde into a $\beta$-ketoester directly with ethyl diazoacetate in the presence of catalytic $\mathrm{SnCl}_{2},{ }^{133}$ but when this was tried on aldehyde 298, only resulted in decomposition. The transformation was therefore carried out in two steps, by treatment of aldehyde 298 with ethyl diazoacetate in the presence of catalytic DBU to afford a mixture of diastereoisomeric alcohols 312, ${ }^{134}$ which was treated with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ to provide $\beta$-ketoester 313 in excellent yield. ${ }^{135}$

Scheme 113

Diazo transfer with para-acetamidobenzenesulfonylazide ${ }^{135}$ successfully generated diazoketone substrate 314. A number of catalysts were then screened to initiate the ammonium ylide rearrangement cascade. The most popular catalysts for diazodecomposition are based on copper and rhodium and so these were selected for this reaction. It is well known that metal carbenes can undergo a number of reactions, namely cyclopropanation, C-H insertion and the formation of ylides with heteroatoms. ${ }^{37}$ Our understanding of the effect of the metal catalyst, and its associated ligands, on the selectivity and reactivity of the metal carbene is quite limited, and so selection was largely based on literature precedent.

As discussed in Scheme 17, Kametani ${ }^{28}$ has successfully used $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ in refluxing benzene to prepare a sulfur ylide, which subsequently underwent a thermal 1,2rearrangement. West has also demonstrated that diazoketone $\mathbf{3 1 6}$ can be converted to hydrazulene $\mathbf{3 1 7}$ through a similar rearrangement using $\mathrm{Cu}(\mathrm{hfacac})_{2}$ in refluxing DCM (Scheme 114). ${ }^{136}$

Scheme 114

Diazoketone $\mathbf{3 1 4}$ was treated with a range of catalysts in various solvents, either at room temperature or at reflux. These conditions include $\mathrm{Cu}(\mathrm{acac})_{2} /$ benzene, $\mathrm{Cu}(\text { hfacac })_{2} / \mathrm{DCM}, \quad \mathrm{CuOTf} /$ benzene, $\mathrm{Cu}(\mathrm{MeCN})_{4} \mathrm{PF}_{6} /$ benzene, $\mathrm{Rh}_{2}(\mathrm{OAc})_{4} /$ benzene, $\mathrm{Rh}_{2}(\mathrm{OAc})_{4} / \mathrm{DCM}$ and $\mathrm{Rh}_{2}(\mathrm{pfb})_{4} /$ benzene. Unfortunately, the starting material $\mathbf{3 1 4}$ was consumed to give acomplex mixture of products from each of these reactions, with no evidence for the formation of desired tricyclic product 315.

### 3.6. Synthesis of an ammonium ylide via an $\alpha$-bromoketone

Whilst the original plan was to synthesise ammonium ylide 319 via a diazoketone, it was envisaged that $\mathbf{3 1 9}$ could also be prepared by a nucleophilic attack of the benzylic
nitrogen onto an appropriate electrophile, such as $\alpha$-bromoketone 321, to form ammonium salt 320, followed by deprotonation to provide ylide 319 (Scheme 115). Hence bromoketone 321 could also serve as a precursor to the ammonium ylide intermediate in the synthesis of the sarain core.

Scheme 115

Treatment of methyl ketone $\mathbf{3 1 0}$ with bromine was expected to provide bromoketone 321; whilst starting material 310 was consumed, a complex mixture of products was returned after aqueous sodium thiosulfate was used to quench the excess bromine. This was partly attributed to the aqueous solubility of an intermediate or product, possibly resulting from formation of the desired ammonium salt 320, or of an equivalent ringopened product. To avoid aqueous workup conditions, 2-methyl-2-butene was used to scavenge any excess bromine before concentration, but again, no product was identified. It was then decided to add $\mathrm{Et}_{3} \mathrm{~N}$ to the reaction mixture prior to concentration, to establish whether the bromination-intramolecular cyclisation-deprotonation protocol could be carried out in situ. While mass spectrometry indicated the presence of some material with the correct formula for tricycle 318, we were unable to isolate the compound responsible for these signals. Unfortunately at this point, the supply of the methyl ketone starting material $\mathbf{3 1 0}$ had been exhausted.

Another attempt to synthesise bromoketone $\mathbf{3 2 1}$ started from a Wittig reaction on aldehyde 298, and although it provided terminal alkene 322 in low yields, it was sufficient to probe a possible bromohydration, followed by oxidation to the desired
bromoketone. Unfortunately, upon treatment of $\mathbf{3 2 2}$ with NBS followed by oxidation with $\mathrm{CrO}_{3}$, a complex mixture of products prevailed (Scheme 116).

Scheme 116

An alternative route to bromoketone $\mathbf{3 2 1}$ was designed in which the final step would be hydration of a bromoalkyne (Scheme 117). Hence aldehyde 298 was converted into terminal alkyne 324; for this purpose the Ohira-Bestmann reagent ${ }^{137} 323$ was slightly higher yielding than the Gilbert-Seyferth reagent. ${ }^{138}$ Notably, the Ohira-Bestmann reagent was prepared by diazo transfer onto the corresponding $\beta$-ketophosphonate 262, and if the phosphonate was used in excess, reagent $\mathbf{3 2 3}$ could be isolated in $95 \%$ yield by simple trituration. This compares well with the $72 \%$ yield obtained when using excess pABSA, in which case column chromatography was required. Treatment of alkyne $\mathbf{3 2 4}$ with NBS and $\mathrm{AgNO}_{3}{ }^{139}$ was expected to provide the terminal bromide $\mathbf{3 2 5}$ to be further hydrated, but instead starting material $\mathbf{3 2 4}$ was recovered.

Scheme 117

### 3.7. An alternative approach to the sarain core

As the previously discussed problems associated with the synthesis of the ylide precursors arose, a related but different route to the sarain core was recognised. Our original strategy involved a Mannich-like disconnection to enolate 326, but rather than enolates, it is enols that are usually the partners in Mannich cyclisations. Thus an alternative approach would involve the preparation of $\mathbf{3 2 7}$ (Scheme 118). In addition to being part of an enol, the olefin moiety of $\mathbf{3 2 7}$ is part of an enamine functionality. Intermediate 327 could therefore be the product of an intramolecular condensation of 328, which bears an aldehyde and a secondary amine moiety. The tosyliminium ion 328 could be the product of acid-catalysed ring opening of the bicyclic aminal 329, as previously observed in the formation of lactam 301, and thus hydroxy-aldehyde 329 presents a new target in this alternative approach to the synthesis of the sarain core.

## Enolate approach

Scheme 118

Whilst it is understood that the $\alpha$-hydroxy-ketone 330, a tautomer of 329, is likely to be more thermodynamically stable, the intramolecular condensation onto the aldehyde group is expected to be significantly faster than onto the ketone. Should condensation onto the ketone take place, the subsequent steps are predicted to be reversible, so with the whole system being in equilibrium, it was predicted that material could be drawn into the desired Mannich cyclisation step (Scheme 119).

Scheme 119

In addition, there are examples in the literature where $\alpha$-hydroxy-ketones have been converted into $\alpha$-amino-ketones, one such being the transformation of 3hydroxycamphor $\mathbf{3 3 1}$ into ketoamine $\mathbf{3 3 2}$ upon treatment with tert-butyl glycinate and $\mathrm{BF}_{3}$. This was presumed to arise through tautomerisation to $\mathbf{3 3 3}$ then imine formation, before re-tautomerisation back to the camphor form (Scheme 120). ${ }^{140}$ Therefore should the position of equilibrium between hydroxy-ketone $\mathbf{3 3 0}$ and hydroxy-aldehyde $\mathbf{3 2 9}$ favour the former, there is still precedent for the formation of enamine $\mathbf{3 2 7}$ through a sequence of reactions similar to those observed in the hydroxycamphor. Furthermore, such considerations also suggested hydroxy-ketone $\mathbf{3 3 0}$ to be a viable target.

Scheme 120

### 3.7.1. Synthesis of a hydroxy-aldehyde

A number of approaches to hydroxy-aldehyde $\mathbf{3 2 9}$ were envisaged, the most direct being the addition of a lithiated dithiane to aldehyde 298, followed by reduction to unmask the corresponding aldehyde. Using this route, Rieger was able to generate the aldehyde 334, which was not isolated, but used immediately in a reductive amination to give 335 in good overall yields (Scheme 121). ${ }^{141}$ The fact that it is possible to manipulate a hydroxy-aldehyde without conversion into the keto-alcohol sets a promising precedent for our chemistry. Unfortunately, treating aldehyde 298 with a lithiated dithiane failed to produce the desired product.

Scheme 121

Another strategy involved a proposed oxidation of alkyne 324 using [bis(trifluoroacetoxy)iodo]benzene (PIFA) ${ }^{142}$ to give either hydroxy-ketone 330, or hydroxy-aldehyde 329 (Scheme 122). When the reaction was carried out, a complex mixture of unidentifiable products and unreacted starting material was recovered.

Scheme 122

In an alternative route, reaction of vinyl magnesium bromide with aldehyde 298 provided allylic alcohol $\mathbf{3 3 6}$ in excellent yields (Scheme 123). Ozonolysis of $\mathbf{3 3 6}$ in the presence of Sudan Red led to a complex mixture of products and so it was decided to
first protect the alcohol functionality. Treatment of $\mathbf{3 3 6}$ with TBSOTf and 2,6-lutidine in DCM provided the protected allylic alcohol 337 in good yields. However, ozonolysis of the alkene in 337 proved unsuccessful, although a two step cleavage protocol, via diol 338 did provide the desired product 339 in poor yields.

Scheme 123

A fourth route investigated to produce $\alpha$-hydroxy-aldehyde $\mathbf{3 2 9}$ was the cyanosilylation of aldehyde 298, followed by a partial reduction of the cyano group to the terminal aldehyde. The cyanosilylation was carried out by treatment of aldehyde $\mathbf{2 9 8}$ with excess TMSCN and catalytic LiCl in an almost solvent free reaction medium ( LiCl was added as a solution in THF), and furnished the desired product $\mathbf{3 4 0}$ in good yields, which was used without purification (Scheme 124). ${ }^{143}$ The reduction to aldehyde 341 was attempted using DIBAH, with a number of methods being employed to remove the aluminium salts. Due to uncertainty over the stability of the product, and the potential for rearrangements, an aqueous workup procedure was approached with caution. In one method, water, aqueous NaOH and $\mathrm{MgSO}_{4}$ were added sequentially and then the insoluble salts were filtered off before concentration. In another, AcOH was used to quench the reaction, and then the salts were filtered off and washed with copious amounts of acetone. The latter method was thought to be advantageous as the acidic conditions should favour the desired cyclisation process, if it had not already been initiated, but neither aldehyde $\mathbf{3 4 1}$ nor the desired tricyclic products were isolated under any conditions investigated.

Scheme 124

Although the crude reaction from the cyanosilylation reaction was almost pure by ${ }^{1} \mathrm{H}$ NMR, it was thought that purification of the product $\mathbf{3 4 0}$ may facilitate the subsequent DIBAH reduction. Purification by column chromatography on Florisil ${ }^{\circledR}$ returned the trimethylsilyloxy product 340 in $58 \%$ yield, with $25 \%$ of the unprotected cyanohydrin also isolated. Unfortunately the major product from a DIBAH reduction of this purified cyanohydrin 340 was the corresponding primary amine $\mathbf{3 4 2}$, from full reduction of the cyano group (Scheme 125).

Scheme 125

Uncertain of whether the problems in the DIBAH reduction were due to the labile nature of the trimethylsilyl protecting group, attention turned to synthesising the equivalent tert-butyldimethylsilyl analogue. Cava ${ }^{144}$ reported high yields for the conversion of aldehydes to TBS protected cyanohydrins, but application of the published conditions of $\mathrm{TBSCl}, \mathrm{KCN}$ and catalytic $\mathrm{ZnI}_{2}$ to substrate 298 instead afforded the unprotected cyanohydrin 343 and the starting material 298 as an inseparable mixture in $\sim 50 \%$ and $\sim 10 \%$ yield respectively (Scheme 126). Treatment of this material with DIBAH resulted in a complex mixture of products.

Scheme 126

Adapting the previously utilised method of TMSCN and LiCl, by direct replacement of TMSCN with TBSCN was not straightforward, as neither the substrate nor reagents are in liquid form at room temperature, and adding the minimum amount of THF to dissolve the reactants gave very low yields ( $<20 \%$ ). Similar yields were obtained when THF was substituted with toluene, but replacing it with DCM provided the TBS protected cyanohydrin 344 in a vastly improved yield of $88 \%$, after purification by silica gel chromatography (Scheme 127).

Scheme 127

DIBAH reduction of tert-butyldimethylsilyl protected cyanohydrin 344 gave a mixture of the desired aldehyde 339 and the fully reduced amine product 345 in variable proportions; the best yields being $42 \%$ and $37 \%$ respectively. It is not understood why there was a significant quantity of amine $\mathbf{3 4 5}$ produced from this reaction, as there is ample literature precedent for the reduction of silylated cyanohydrins to aldehydes under the same conditions, often with a greater excess of DIBAH than that employed in this reaction. Changing the number of equivalents of DIBAH, or the solvent of the reaction, failed to improve yields. Therefore while formation of aldehyde $\mathbf{3 3 9}$ was possible using this method, the variable ratio of amine and aldehyde produced presented a frustrating drawback to the supply of material for subsequent research.

### 3.7.2. Rearrangement of a hydroxy-aldehyde derivative

As the aldehyde 339 did not spontaneously undergo the rearrangement cascade to $\mathbf{3 1 8}$ (Scheme 118), it was treated with a range of acids to promote this process (Table 13).

Table 13

| Entry | Conditions | Result |
| :---: | :---: | :---: |
| 1 | $\mathrm{AcOH}, \mathrm{NaOAc}, \mathrm{MeOH}$ | Starting material recovered |
| 2 | $\mathrm{AcOH}, \mathrm{MeOH}$ | Starting material recovered |
| 3 | $\mathrm{AcOH}, \mathrm{MeOH}, 65{ }^{\circ} \mathrm{C}$ |  |
| 4 | $p \mathrm{TsOH}, 4 \AA \mathrm{MS}, \mathrm{DCM}$ | SM, 346 and decomposition |
| 5 | TfOH, 1,4-dioxane | Decomposition |
| 6 | Stir with 2 M HCl then basify | Decomposition |
| 7 | Extract into HCl , remove DCM layer, then neutralise | Decomposition |
| 8 | TBAF, THF | Decomposition |
| 9 | $\mathrm{NH}_{4} \mathrm{~F}, \mathrm{MeOH}$ | 20\% SM and decomposition |
| 10 | Amberlyst ${ }^{\circledR}-15, \mathrm{DCM}$ | Starting material recovered |
| 11 | Dowex ${ }^{\text {® }}$-50 | Decomposition |

${ }^{\text {a }}$ This was isolated with a small amount of impurities. In addition, the moderate yield of this reaction can be partly attributed to the small scale of the reaction, as the crude material consisted almost entirely of this product.

Treatment of aldehyde $\mathbf{3 3 9}$ with AcOH in MeOH at room temperature, with or without NaOAc buffer, led to no reaction, with starting material 339 being recovered. However, when the unbuffered reaction was warmed to $65{ }^{\circ} \mathrm{C}$ for 3 d , a new compound was produced (entry 3). This compound was identified as tricycle 346 (vide infra).

A mechanism for the formation of the tricyclic product is proposed in Scheme 128; ring opening of the bicyclic aminal by cleavage of the C-NTs bond leads to sulfonamide 347, which can undergo an intramolecular condensation with the aldehyde to form enesulfonamide 348; subsequent cyclisation onto the benzyliminium ion provides tricycle 349, which after hydration will furnish the observed product 346. Another viable route is for the aldehyde in $\mathbf{3 4 7}$ to act as a nucleophile in its enol form, 350, and cyclise onto the benzyliminium ion to form bicycle 351; hemiaminal formation between the aldehyde and sulfonamide will then provide tricycle 346.

The structure of the isolated product was deciphered through extensive NMR spectroscopic work; based on the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts, the product could correspond to either $\mathbf{3 4 6}$ or 346a, with the latter resulting from a similar mechanism as proposed above, but with inital cleavage of the C-NBn bond rather than the C-NTs bond (Scheme 129). However, HMBC and NOESY experiments identified the isolated product to be 346, as there are clear couplings between the benzylic protons and the bridging tertiary carbon, and also between the proton on the carbon bearing the alcohol and the secondary carbon adjacent to the sulfonamide, as indicated in the scheme.

339

346a

Scheme 129

The production and isolation of tricycle $\mathbf{3 4 6}$ presents two problems: first, the ring opening of the bicyclic aminal proceeded in the wrong direction - with cleavage of the C-NTs rather than the C-NBn bond; secondly, should the mechanism of formation progress via compound 348, then the cyclisation onto the benzyliminium ion took place from the enamine functionality, rather than from the enol as desired.

The mode of aminal opening can be rationalised by the fact that the benzylamine is more electron-releasing, and the sulfonamide is more electron-withdrawing, so indeed the formation of iminion ion $\mathbf{3 4 7}$ is entirely normal. But if the benzylamine group were protonated, the ring opening process was expected to proceed in the opposite direction, as was the case in the formation of lactam 301 in section 3.5.1. It was hoped that this difference in outcome could be governed by the nature of the acid used, and therefore stronger acids were screened for this reaction. Use of $p \mathrm{TsOH}$ and $4 \AA \mathrm{MS}$ resulted in partial conversion of aldehyde 339 to tricycle 346, while TfOH led to decomposition (entries 4 and 5). Addition of HCl to aldehyde $\mathbf{3 3 9}$ was expected to mimic the process that led the correct direction of ring opening to form lactam 301, but here only resulted in a complex mixture of products (entries 6 and 7). This was also the case when silyl deprotecting reagents TBAF and $\mathrm{NH}_{4} \mathrm{~F}$ were employed (entries 8 and 9). The use of solid supported acidic resins Amberlyst ${ }^{\circledR}-15$ and Dowex ${ }^{\circledR}-50$ also failed to provide the desired cyclisation material (entries 10-11).

The second problem in the formation of tricycle 346 via 348 is that it occurred through the enamine rather than the tert-butyldimethylsilyl enol ether; this may have been contributed by the presence of the bulky protecting group. In contrast, the DIBAH reduction of the unprotected cyanohydrin $\mathbf{3 4 3}$ generated a complex mixture of products. The employment of a different protecting group, which allows for isolation of the protected hydroxy-aldehyde prior to the rearrangement step (cf. 353), may be useful in circumventing this problem. Synthesis of these compounds was approached by the protection of allylic alcohol 336. The sterically demanding but acid labile trityl group was chosen for this investigation, but unfortunately, treatment of allylic alcohol 336 with trityl chloride failed to provide 352 (Scheme 130).

Scheme 130
Another idea was to synthesise epoxy-acetal 354, which upon treatment with acid would undergo ring-opening of the acetal, generating hydroxy-oxonium ion 355 (Scheme 131). This would thus create a more electrophilic moiety than an aldehyde, aiding ring cyclisation/condensation.

Scheme 131

The synthesis of epoxide 354 began by a Wittig olefination of aldehyde 298 with methoxymethyltriphenylphosphonium chloride, ${ }^{145}$ forming methoxy enol ether $\mathbf{3 5 6}$ as a 3:2 E:Z mixture of geometrical isomers in moderate yield. Attempted epoxidation of olefin 356 with $m$ CPBA instead resulted in oxidation of the benzylamine to form N oxide 357 in an almost quantitative yield (Scheme 132). In another attempt, reaction with singlet oxygen ${ }^{146}$ resulted in both the recovery of starting material, in an increased
$E: Z$ ratio of $>10: 1$, and also the formation of $\alpha, \beta$-unsaturated aldehyde 358 . This product presumably results from ene reaction of the enol ether $\mathbf{3 5 6}$ with singlet oxygen, which after reduction with DMS, gives a hemiacetal that then collapses to give the isolated aldehyde. The change in the ratio of the geometric isomers between the starting material and product can be attributed to the higher rate of ene reaction for the $Z$ - compared to the $E$-isomer of enol ether 356. ${ }^{147,148}$

Scheme 132

At this stage, time constraints and exhausted supply of material prevented further investigation into the rearrangement of protected hydroxy-aldehyde 339, and similar derivatives, into the tricyclic sarain core.

## 4. SYNTHESIS OF 3-AMINO-2-SILYLOXYACRYLATES BY OLEFINATION OF FORMAMIDES

In addition to the work towards the synthesis of the sarain core, a study into an unusual olefination of formamides was carried out and is reported herein.

### 4.1. Background

Previous work within the Porter group investigated the feasibility of the proposed intramolecular rearrangement of an ammonium ylide as a route to the sarain core by mimicking it in an intermolecular fashion. To do this, simple bicyclic aminal 93, which lacks the side chain, was treated with a silylated diazoacetate in the presence of a metal catalyst. This was anticipated to result in ammonium ylide formation from the more nucleophilic nitrogen, ring opening followed by ring closure to give 96, a ringexpansion product (Scheme 133).

## Approach to sarain core

Intermolecular mimic:

Scheme 133

Prior to this, our group had successfully developed conditions to perform ring expansions of 1,3-oxathiolanes, where treatment with ethyl (triethylsilyl)diazoacetate (359) in the presence of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ or $\mathrm{Cu}(\mathrm{acac})_{2}$ led to rearrangement of the sulfur ylide intermediate to provide the corresponding 1,4-oxathianes in moderate yields (Scheme 134). ${ }^{149,150}$ The presence of the silyl group in the diazoacetate was found to be important as it suppresses the undesirable carbene dimerisation observed when using ethyl
diazoacetate, as well as any further reaction of the oxathiane products with excess diazo reagent.

Scheme 134: Ring-expansion of 1,3-oxathiolanes

When bicyclic aminal 93 was treated with diazoester 359 in the presence of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$, rather than undergoing a ring-expansion, the formamide underwent an unexpected olefination to provide 97 in $39 \%$ yield. A rationale for the formation of this product could be that instead of reacting with the amine to form an ammonium ylide, the metal carbene reacted at the formamide oxygen to provide carbonyl ylide $\mathbf{3 6 0}$ (Scheme 135). Formation of epoxide $\mathbf{3 6 1}$ followed by ring opening, and then migration of the silyl group to the alkoxide in $\mathbf{3 6 2}$ would furnish the observed olefination product $\mathbf{9 7}$.

Scheme 135: Proposed mechanism for the olefination of formamide carbonyl group

The mechanism to this reaction bears similarities to that proposed by Padwa for the cyclisation of amido diazo carbonyl compounds, where treatment of diazoketone 363 with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ led to formation of dihydropyridone 366 in good yields (Scheme 136). ${ }^{151}$ The metal carbene reacted at the amido oxygen to give oxonium ylide $\mathbf{3 6 4}$, and then epoxide 365, which isomerised to the observed product.

Scheme 136

In addition, related intramolecular reactions between diazo carbonyl compounds and thiolactams have been reported, where the metal carbene forms a thiocarbonyl ylide. This chemistry was utilised by Danishefsky in the syntheses of iso-A58365A ${ }^{152}$ and indolizomycin; ${ }^{153}$ in one intermolecular example, thiolactam 367 was treated with ethyl diazoacetate and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ to give vinylogous urethane $\mathbf{3 6 8}$ in moderate yields (Scheme 137). ${ }^{153}$

Scheme 137

## 4.2. $N$-Formylpyrrolidine as a test substrate

Investigative efforts into the scope and limitations of this reaction began using $N$ formylpyrrolidine (369a) as a test substrate. This was prepared in excellent yields by heating pyrrolidine in excess ethyl formate under reflux. As with the bicyclic aminal, treatment of $N$-formylpyrrolidine (369a) with ethyl (triethylsilyl)diazoacetate (359) in the presence of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ provided the vinylogous carbamate 370a. Upon optimisation, it was found that only $0.4 \mathrm{~mol} \%$ of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ was required to catalyse the reaction. Interestingly the acrylate $\mathbf{3 7 0}$ a was obtained as a single geometric isomer. This was established to have the $Z$-geometry by observation of a nuclear Overhauser enhancement in the ${ }^{1} \mathrm{H}$ NMR spectrum between the $\alpha$-protons on the pyrrolidine ring and the methylene protons of the triethylsilyl moiety (Scheme 138).

Scheme 138

Purification of vinylogous carbamate 370a by chromatography on alumina gave a better yield ( $80 \%$ ) than on silica gel ( $50 \%$ ), presumably due to hydrolysis of the triethylsilyl group on the acidic support. The reaction was found to be complete within 90 min and prolonging the reaction time to 16 h produced similar yields ( $89 \%$ ), with no observed decomposition of the product.

In addition, a series of control experiments was carried out, which confirmed that no reaction took place in the absence of the catalyst, with both starting materials $\mathbf{3 5 9}$ and 369a recovered unchanged. If ethyl diazoacetate was used in place of the silylated analogue, the starting amide 369a remained unreacted, but ethyl diazoacetate was consumed in a dimerisation reaction to form a mixture of diethyl fumarate and diethyl maleate.

### 4.3. Tertiary formamides as substrates

A number of tertiary formamides ( $\mathbf{3 6 9} \mathbf{a - 3 6 9 1}$ ) were prepared to investigate the scope of this reaction (Figure 10), and with the exception of dimethyl formamide, $\mathbf{3 6 9 h}$, were obtained by treatment of the corresponding secondary amines with ethyl formate. N Benzylallylamine was synthesised from the reaction of allylamine and benzyl bromide, ${ }^{154}$ all other amines were obtained from commercial sources.

Figure 10: Formamide substrates for olefination reaction

These formamides (369b-3691) were exposed to the conditions developed for N formylpyrrolidine 369a, and all successfully reacted to provide the corresponding vinylogous carbamates ( $\mathbf{3 7 0 b} \mathbf{- 3 7 0 1}$, Table 14). ${ }^{155}$ Several reactions were repeated to confirm no significant difference between the yields obtained for reactions of 90 min duration and those for 16 h (entries 1-3, 8-10). The reactions were generally very efficient, producing the olefin products in greater than $80 \%$ yield, but substrates $\mathbf{3 6 9 e}$ $\mathbf{3 6 9 g}$, which contain a tertiary amine (entries 5-7), consistently gave lower yields. Monitoring the reaction of 1-formyl-4-methylpiperazine (369e) by ${ }^{1} \mathrm{H}$ NMR spectroscopy showed that it took place very slowly, although a respectable yield of $63 \%$ was obtained by addition of extra catalyst and diazoacetate in combination with extended reaction time. This reduced reactivity is thought to be due to competitive complexation of its tertiary amine to the rhodium catalyst. With the intention of overcoming this problem, the same reaction was carried out with $4 \mathrm{~mol} \%$ catalyst, but this only provided 370e in $55 \%$ yield after 63 h . Complete conversion of benzhydrylpiperazine $\mathbf{3 6 9 f}$ to $\mathbf{3 7 0 f}$ took almost 3 h , and the 3 -chlorophenyl piperazine $(\mathbf{3 6 9 g})$ gave moderately decreased yields in the olefination, but nevertheless, still furnished the desired products in comparatively short times. The higher rate of these reactions (compared to that of $\mathbf{3 6 9}$ e) was attributed to the steric bulk around the nitrogen in $\mathbf{3 6 9 f}$, and its decreased basicity in $\mathbf{3 6 9 g}$, reducing the unwanted complexation to the catalyst.

Table 14: Conversion of formamides to vinylogous carbamates

| Entry | Formamide 369 |  | Vinylogous carbamate 370 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Substrate | Yield / \% | Time | Yield / \% | After 16 h / \% |
| 1 | $\mathbf{a}$ | 95 | 90 min | 80 | 89 |
| 2 | $\mathbf{b}$ | 95 | 90 min | 83 | 92 |
| 3 | $\mathbf{c}$ | 91 | 90 min | 87 | 89 |
| 4 | $\mathbf{d}$ | 99 | 45 min | 90 | - |
| 5 | $\mathbf{e}$ | 93 | $240 \mathrm{~h}^{\mathrm{a}}$ | 63 | - |
| 6 | $\mathbf{f}$ | 99 | 165 min | 87 | - |
| 7 | $\mathbf{g}$ | 99 | 45 min | 64 |  |
| 8 | $\mathbf{h}$ | - | 90 min | 90 | 89 |
| 9 | $\mathbf{i}$ | 96 | 90 min | 85 | 81 |
| 10 | $\mathbf{j}$ | 88 | 90 min | 97 | 96 |
| 11 | $\mathbf{k}$ | 100 | 90 min | 69 | - |
| 12 | $\mathbf{l}$ | 80 | 180 min | $50^{\mathrm{b}}$ | - |
| ${ }^{\text {a }} \mathrm{E}$ |  |  |  |  |  |

${ }^{\text {a }}$ Extra portion of catalyst and ethyl diazo(triethylsilyl)acetate added after 144 h ;
${ }^{\mathrm{b}} 3: 2$ ratio of $Z$ and $E$ isomers

A number of symmetrical and unsymmetrical acyclic formamides ( $\mathbf{3 6 9 h} \mathbf{- 3 6 9 1}$ ) were also converted to the corresponding vinylogous carbamates ( $\mathbf{3 7 0 h}-\mathbf{3 7 0 1}$ ), with varying degrees of success (entries 8-12). The use of rhodium carbenes in the cyclopropanation of alkenes is well documented, ${ }^{37}$ and it is interesting to note that there was no evidence of such a competitive reaction from substrates containing isolated alkene moieties ( $\mathbf{3 6 9} \mathbf{i}$ and $\mathbf{3 6 9 j}$ ).

For substrates $\mathbf{3 6 9 a} \mathbf{- 3 6 9 k}$, olefin products $\mathbf{3 7 0 a}-\mathbf{3 7 0 k}$ were produced exclusively as the $Z$-isomer; it is not clear why the reaction is so stereoselective. Interconversion of the product isomers is expected to be relatively easy due to the decreased double bond character of such systems (Scheme 139) and hence the observed stereoselectivity may simply reflect the greater thermodynamic stability of the Z-isomers. ${ }^{156,157}$

Scheme 139

Only upon reaction of formanilide $\mathbf{3 6 9 1}$ was the product $\mathbf{3 7 0 1}$ obtained as a mixture of geometric isomers (entry 12). This was thought to be due to the lesser extent of electron release from the nitrogen, hence suppressing this equilibration. There was no sign of any isomerisation to the $E$-isomer when a solution of $Z$-olefin $\mathbf{3 7 0 1}$ was heated in benzene at reflux overnight.

Scheme 140

### 4.4. Trapping the intermediate 1,3-dipole

In the mechanism proposed in Scheme 135 for the olefination reaction, a 1,3-dipole system is created in intermediate $\mathbf{3 6 0}$. To confirm the mechanism, and expand the utility of the reaction, attempts to trap this dipole were explored. Addition of dimethyl acetylenedicarboxylate was expected to provide a competing pathway for an
intermolecular interception of the dipole, but there was no evidence for the formation of substituted dihydrofuran 371. Instead vinylogous carbamate $\mathbf{3 7 0 g}$ was isolated in a lowered yield of $38 \%$, compared to the $64 \%$ that was isolated in the absence of the acetylene.

Scheme 141: Attempted intermolecular interception of 1,3-dipole
$N$-Benzyl- $N$-(but-3-enyl)formamide ( $\mathbf{3 6 9 m}$ ) was also prepared in an attempt to trap the dipole intramolecularly. It was thought that the $\gamma, \delta$-unsaturated formamide could give rise to the bicyclic hemiaminal $\mathbf{3 7 2}$ as a competing product, but instead gave the usual vinylogous carbamate $\mathbf{3 7 0 m}$ in an excellent yield (Scheme 142).

## Scheme 142: Attempted intramolecular interception of 1,3-dipole

### 4.5. Other substrates

To briefly examine the possibility of utilising other amide substrates in the olefination reaction, a secondary formamide ( N -methylformamide) and a tertiary acetamide ( $\mathrm{N}, \mathrm{N}$ dimethylacetamide) were subjected to the same conditions. Unfortunately purification of the products from these reactions was difficult, and there was no conclusive evidence to suggest that either had undergone the desired olefination.

### 4.6. Deprotection of silyl enol ether

To explore the possibility of further functionalisation of the 3-amino-2silyloxyacrylates, they were exposed to a number of different deprotection protocols (Table 15). Use of TBAF or aqueous HCl was unsuccessful, with low mass recovery after aqueous workup (entries 1-3). Low yields were obtained from using $\mathrm{NH}_{4} \mathrm{~F}$, but again with low mass recovery (entry 4). The considerable aqueous solubility of enol products $\mathbf{3 7 3}$ may help to explain why only a small amount of materials was recovered after aqueous workup. Other substrates were therefore treated with $\mathrm{NH}_{4} \mathrm{~F}$, but to reduce solubility problems, brine rather than water was used in the workup. This greatly
increased the recovery of products, but rather unexpectedly, the production of formamide $\mathbf{3 6 9}$ was also observed.

Table 15: Deprotection of silyl enol ether

| Entry | Substrate | Reagents | Product | Yield / \% |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 370c | TBAF, THF | 373c | 0 |
| 2 | 370a | TBAF, THF | 373a | 0 |
| 3 | 370f | $10 \% \mathrm{HCl}, \mathrm{MeOH}, \mathrm{THF}$ | $\mathbf{3 7 3 f}$ | 0 |
| 4 | $\mathbf{3 7 0 j}$ | $\mathrm{NH}_{4} \mathrm{~F}, \mathrm{MeOH}$ | $\mathbf{3 7 3 j}$ | $<5$ |
| 5 | $\mathbf{3 7 0 d}$ | $\mathrm{NH}_{4} \mathrm{~F}, \mathrm{MeOH}$ | $\mathbf{3 7 3 d}$ | $<30$ |
| 6 | $\mathbf{3 7 0 f}$ | $\mathrm{NH}_{4} \mathrm{~F}, \mathrm{MeOH}, \mathrm{THF}$ | $\mathbf{3 7 3 f}$ | $<44$ |

The crude deprotection product from ketal substrate 370d contained a small amount of the corresponding formamide 369d, but when this was exposed to silica gel purification, the proportion of the formamide greatly increased. Likewise, it was possible to separate the benzhydryl deprotection product $\mathbf{3 7 3 f}$ from the corresponding formamide $\mathbf{3 6 9 f}$ temporarily, but upon standing at room temperature, the material became contaminated once again with formamide 369f. A mechanism for this hydrolysis is proposed whereby addition of water to iminium ion $\mathbf{3 7 4}$ leads to olefin $\mathbf{3 7 5}$ which upon tautomerisation to 376, can undergo a retro-aldol pathway to provide the formamide (Scheme 143). However, ethyl glycolate 377 was not observed as a by-product in this reaction.

## Scheme 143: Proposed mechanism for the formation of the formamide

In conclusion, a new and general method for the conversion of tertiary formamides to 3-amino-2-silyloxyacrylates has been discovered. Future work in this area would include investigations into the reactivity and further functionalisation of this novel class of compounds.

## 5. CONCLUSIONS AND FUTURE PERSPECTIVES

This thesis describes a proposal for a novel carbene-derived ammonium ylide rearrangement as an approach to target 318, which contains the tricyclic framework of the sarain core (Scheme 144). To provide a substrate for this rearrangement, the main aim of the research was to develop a route to functionalised bicyclic aminal $\mathbf{3 0 0}$.

Scheme 144

A number of strategies to synthesise $\mathbf{3 0 0}$ were investigated; the initial approach involved a Diels-Alder reaction using a chiral dienophile to provide an enantioselective synthesis of 203 (Scheme 145). This reaction proceeded with excellent regio- and diastereoselectivity, but transformation into $\mathbf{2 1 3}$ proved troublesome. In another asymmetric Diels-Alder approach, use of Corey's oxazaborolidine catalyst in reactions with dienophile 239 to give 244 was unsuccessful due to the low reactivity and solubility of 239. Uncatalysed reactions required high temperatures for the dienophile to react, resulting in significant double bond isomerisation in adduct 244, from the desired $\mathrm{C} 1-\mathrm{C} 2$ to the $\mathrm{C} 2-\mathrm{C} 3$ position.

Asymmetric Diels-Alder reaction using a chiral dienophile

Asymmetric Diels-Alder reaction using a chiral catalyst

Scheme 145

In racemic approaches, the use of a Michael reaction was unsuccessful, but successful installation of the required stereochemistry was achieved by use of a thio-Claisen rearrangement. Under optimised conditions, the simple thiolactam substrate $\mathbf{2 8 1}$ was converted into 282 in good yield and excellent diastereoselectivity (Scheme 146). Bicyclic aminal 292 was prepared using an optimised reductive cyclisation methodology, and incorporation of a methyl group at C3a (292) prevented the problems of ring isomerisation in substrates that were unfunctionalised at that position. Further transformations provided carboxylic acid 299, but conversion into the desired diazoketone $\mathbf{3 0 0}$ was unsuccessful, instead generating lactam 301.

Scheme 146

Over the course of this research, a further three different, but related routes to the sarain core were investigated, including the synthesis of diazoester 314, bromoketone 321 and hydroxy-aldehyde 339 (Scheme 147). Substrates to test the proposed rearrangement reactions were synthesised, using aldehyde 298 as the common branching point.

339
$\downarrow \begin{gathered}\mathrm{AcOH}, \mathrm{MeOH} \\ 65^{\circ} \mathrm{C}\end{gathered}$

346

Scheme 147

Diazoester 314 was prepared starting from reaction of aldehyde 298 with ethyl diazoacetate followed by treatment with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$, and then a diazo transfer reaction. Unfortunately, exposure of $\mathbf{3 1 4}$ to a number of metal catalysts failed to provide the ethyl ester derivative of the sarain core. However, the options of metal catalysts or solvent systems that can be used to promote this rearrangement have not been exhausted. In addition, a photochemical, rather than a thermal process could be employed to generate the metallocarbene, and thus the ylide; in work towards the synthesis of the Tagetitoxin, our group recently utilised a photo-Stevens rearrangement to generate $\mathbf{3 8 0}$ from diazoester 378 (Scheme 148). ${ }^{158}$ Upon treatment with $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ in refluxing benzene, ylide 379 was isolated, and found to be stable under thermal conditions, in various solvents and also to microwave heating. However, upon photolysis of $\mathbf{3 7 9}$, the desired compound $\mathbf{3 8 0}$ was obtained in $69 \%$ yield. Applications of similar system to diazoester 314 to generate the sarain core $\mathbf{3 1 5}$ could be investigated.

Scheme 148

Synthesis of an $\alpha$-bromoketone as a viable route towards the synthesis of $\mathbf{3 1 8}$ was also investigated, using a variety of approaches. Although most were fruitless, the results from one attempt, involving first treatment of the corresponding methyl ketone with bromine followed by addition of triethylamine, were promising. The mass spectra of the products indicated the presence of some material with the correct formula for tricycle 318, and thus warrant further investigation into this reaction.

In the final approach, protected hydroxy-aldehyde 339 was prepared from a cyanosilylation reaction. Whilst treatment with a number of acids to promote rearrangement failed to provide desired tricycle 318, a different tricyclic compound 346 was produced. Future work in this area would involve the continued investigation into using this acid catalysed rearrangement of hydroxy-aldehyde 339. A relatively small selection of acids was used in our studies, with the potential for many more - using acids of different strengths, including Lewis acids. One of the limiting factors in this investigation was the difficulties in preparing reliable quantities of the tertbutyldimethylsilyl protected hydroxy-aldehyde 339, so a more efficient preparation of this material would be favoured. In addition, changing the protecting groups on the bicyclic aminals may be useful in promoting the ring opening process to occur in the desired direction.

All four approaches to the sarain core employ a methylated substrate that would ultimately lead to a methylated derivative of $( \pm)$-sarain A. The purpose of the additional methyl group was to prevent the ring isomerisation of the bicyclic aminal. Ideally, the methyl group should be replaced with a more labile group so that it can be removed at the end of the synthesis. An asymmetric thio-Claisen replacement would also allow for an enantioselective route to the sarain core.

Finally, in a separate investigation, it was found that treatment of tertiary formamides with a silylated diazoester in the presence of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ leads to formation of 3-amino-2-silyloxyacrylates in good yields (Scheme 149). Future work in this area would involve investigations into the reactivity and further functionalisation of this novel class of compounds.

Scheme 149

## 6. EXPERIMENTAL

## General

All reactions carried out in non-aqueous conditions were performed under argon, using flame-dried flasks.

## Reagents

Chemicals were purchased from Aldrich, Alfa Aesar, Acros, Fluka, Fisher, BDH or STREM, and unless otherwise stated, were used without further purification.

- $\mathrm{NH}_{2} \mathrm{Bn}, \mathrm{Et}_{3} \mathrm{~N}$, DIPEA and 2,6-lutidine were distilled from $\mathrm{CaH}_{2}$ and stored over KOH .
- Pyridine and MVK were distilled from $\mathrm{CaH}_{2}$ and stored over $4 \AA$ MS.
- Isobutyl chloroformate and furfural were distilled and stored over $4 \AA$ MS.
- Methyl-4-bromocrotonate was purified by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{Et}_{2} \mathrm{O}: \mathrm{PS}\right.$ 2:3).
- TMSCl was distilled from $\mathrm{CaH}_{2}$.
- LiCl was flame dried under vacuum before use.
- TsCl and NBS were recrystallised according to procedures described in "Purification of Laboratory Materials". ${ }^{159}$
- Lawesson's reagent was prepared using a procedure described by Clausen et al, ${ }^{160}$ and Dess-Martin Periodinane using a procedure described by Boeckman et al. ${ }^{117}$

A saturated solution refers to a saturated aqueous solution.

## Solvents

- DCM, $\mathrm{Et}_{2} \mathrm{O}, \mathrm{MeCN}, \mathrm{THF}$ and toluene were obtained from the UCL Chemistry Department's Anhydrous Solvent System (dried by passage through activated alumina columns under a nitrogen atmosphere).
- DMF and acetone were distilled from, and stored over $4 \AA$ MS.
- DMSO, benzene and ${ }^{\mathrm{i}} \mathrm{PrOH}$ were distilled from $\mathrm{CaH}_{2}$ and stored over $4 \AA \mathrm{MS}$.

PS refers to petroleum ether that boils in the range $40-60^{\circ} \mathrm{C}$.

## Chromatography

Flash chromatography was carried out on Merck silica gel $60(40-60 \mu \mathrm{~m})$, Florisil ${ }^{\circledR}$ (100-200 mesh), or either neutral, or basic, aluminium oxide (deactivated to grade III with $6 \% \mathrm{w} / \mathrm{v}$ water, $40-60 \mu \mathrm{~m}$ ). Preparative thin layer chromatography was performed on glass plated pre-coated with normal phase Merck silica gel $60 \mathrm{~F}_{254}(0.25 \mathrm{~mm}$ layer thickness). TLC was performed on Merck Kieselgel $60 \mathrm{~F}_{254}$ aluminium sheets, visualised with short wavelength ultraviolet light ( 254 nm ) and through staining with potassium permanganate, iodine, vanillin, anisaldehyde, or 2,4-DNP.

## Spectroscopy/spectrometry

Infrared (IR) spectra were recorded on a SHIMADZU FT-IR 8700 spectrometer using potassium bromide ( KBr ) disks.

Proton nuclear magnetic resonance spectra ( ${ }^{1} \mathrm{H} \mathrm{NMR}$ ) were recorded at $300 \mathrm{MHz}, 400$ MHz or 500 MHz on Bruker AMX-300, AMX-400 and AMX-500 spectrometers respectively. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on the same instruments at $75 \mathrm{MHz}, 100$ MHz or 125 MHz . Chemical shifts ( $\delta$ ) are recorded in parts per million ( ppm ), and reported with reference to the solvent peak. The signals are denoted as $s=\operatorname{singlet}, \mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{qu}=$ quintet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{dt}=$ doublet of triplets, $\mathrm{dq}=$ doublet of quartets, $\mathrm{td}=$ triplet of doublets, ddd $=$ doublet of doublets of doublets, ddt $=$ doublet of doublets of triplets, dddd $=$ doublet of doublets of doublets of doublets, $\mathrm{m}=$ multiplet and $\mathrm{br}=$ broad. Coupling constants $(J)$, reported in hertz, are calculated from observed chemical shifts, and can have an accuracy margin of $\pm 0.3 \mathrm{~Hz}$. COSY, DEPT, HMQC and HMBC were routinely used to aid assignment of spectra. Nuclear Overhauser enhancement experiments were performed by Dr Abil Aliev, Department of Chemistry, UCL.

Low resolution and high resolution mass spectra were measured by Mr John Hill or Dr Lisa Harris, both from Department of Chemistry, UCL. The instruments used were VG70-SE (CI+, EI+, FAB+) or Thermo MAT 900 (ESI+, ESP+).

Elemental analyses were carried out by Mrs Jill Maxwell, Department of Chemistry, UCL, and were recorded on a Perkin Elmer 2400 CHN elemental analyser.

## Other

Melting points were determined with an Electrothermal 9100 instrument.

Microwave oven experiments were carried out in a CEM Discover instrument, with a maximum power of 250 W .

Lamp used was an IQ Premier Floodlight 500W tungsten halogen lamp.

### 6.1. Studies towards the synthesis of the core of sarains A, B \& C

5-Hydroxy-2-(5H)-furanone (195) ${ }^{69}$

Through a solution of distilled furfural $(110 \mathrm{~g}, 1.15 \mathrm{~mol})$ and rose bengal $(1.36 \mathrm{~g}, 1.34$ mmol ) in $\mathrm{MeOH}(600 \mathrm{~mL}$ ) was slowly bubbled oxygen, while the solution was irradiated with a 500 W tungsten filament lamp. The reaction temperature was maintained below $33{ }^{\circ} \mathrm{C}$ at all times by external cooling. After 55 h , the solvent was removed in vacuo. The brown solid that formed overnight was filtered, washed twice with cold $\mathrm{CHCl}_{3}\left(80 \mathrm{~mL},-78{ }^{\circ} \mathrm{C}\right)$ and dried under high vacuum to afford furanone $195^{67}(44.5 \mathrm{~g}, 39 \%)$ as a pale orange solid. Addition of a seed crystal to a stirring solution of the combined mother liquors in chloroform $\left(-78{ }^{\circ} \mathrm{C}\right)$ followed by filtration of the resulting crystals provided an extra 15.3 g of the furanone (total yield 59.2 g , $52 \%$ ); m.p. $57-59{ }^{\circ} \mathrm{C}$ [lit. $\left.{ }^{67} 57.3-59.2{ }^{\circ} \mathrm{C}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.31(1 \mathrm{H}, \mathrm{dd}, J 5.7$, $1.2, \mathrm{HC}=\mathrm{CHCH}), 6.24(1 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{CCH}), 6.21(1 \mathrm{H}, \mathrm{dd}, J 5.7,1.3, \mathrm{CHOH}), 5.24(1 \mathrm{H}, \mathrm{br}$ $\mathrm{s}, \mathrm{OH}) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.4(\mathrm{O}=\mathrm{C}), 152.0(\mathrm{HC}=\mathrm{CHCH}), 124.7(\mathrm{O}=\mathrm{CCH}), 98.8$ $(C H(O H))$.
(5R)-5-(L-Menthyloxy)-2-(5H)-furanone (197) ${ }^{67,69}$

A 250 mL round bottomed flask equipped with a 10 mL Dean-Stark trap was charged with 5-hydroxy-2-( 5 H )-furanone ( $25.1 \mathrm{~g}, 251 \mathrm{mmol}$ ), L-menthol ( $35.0 \mathrm{~g}, 224 \mathrm{mmol}$ ) and benzene ( 125 mL ). D-(+)-Camphorsulfonic acid ( $2.67 \mathrm{~g}, 11.5 \mathrm{mmol}$ ) was added and the stirring mixture heated at reflux for 7 h . After cooling to $0{ }^{\circ} \mathrm{C}$, saturated $\mathrm{NaHCO}_{3}$
( 125 mL ) was added and the resulting suspension stirred for 3 h as it warmed to room temperature. DCM ( 250 mL ) was added to the mixture and the organic layer was removed, washed with brine ( $3 \times 200 \mathrm{~mL}$ ) and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{DCM}\right)$ gave a pale yellow oil, which solidified overnight to afford a 1:1 diastereoisomeric mixture of the menthyloxybutenolides ( $51.8 \mathrm{~g}, 97 \%$ ). Three recrystallisations from PS $\left(40-60{ }^{\circ} \mathrm{C}\right.$ ) furnished desired diastereoisomer $197(17.1 \mathrm{~g}, 34 \%)$ as white needles.

## Acid catalysed epimerisation ${ }^{69}$

The combined mother liquors from the recrystallisations (i.e. predominantly diastereoisomer 196) were concentrated to dryness, dissolved in benzene ( 40 mL ) and concentrated again. The resulting solid ( $51.3 \mathrm{~g}, 215 \mathrm{mmol}$ ) and D-(+)-camphorsulfonic acid $(2.00 \mathrm{~g}, 8.6 \mathrm{mmol})$ in $\mathrm{DCM}(150 \mathrm{~mL})$ were heated at reflux for 16 h . The reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$, added saturated $\mathrm{NaHCO}_{3}(40 \mathrm{~mL})$, then stirred for 3 h while warming to room temperature. The organic phase was separated and washed with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$, brine ( $3 \times 150 \mathrm{~mL}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$, and then concentrated to afford a yellow oil which solidified overnight. Two recrystallisations from PS ( $40-60{ }^{\circ} \mathrm{C}$ ) provided additional diastereoisomer 197 (11.3g, 24\%); m.p. $80-81^{\circ} \mathrm{C}\left[l i t .{ }^{69} 79-80{ }^{\circ} \mathrm{C}\right]$; $[\alpha]_{D}^{20}-139.2\left(\mathrm{CHCl}_{3}, \mathrm{c} 8.2\right)\left[\mathrm{lit.}^{69}[\alpha]_{D}^{20}-135.1\left(\mathrm{CHCl}_{3}, \mathrm{c} 8.2\right)\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 7.15 ( 1 H , dd, J 5.7, 1.2, HC=CHCH), 6.19 ( 1 H , dd, J 5.7, 1.2, OCHO), 6.08-6.07 (1H, $\mathrm{m}, \mathrm{O}=\mathrm{CCH}), 3.65\left(1 \mathrm{H}, \mathrm{td}, J 10.8,4.4, \mathrm{OCHCH}_{2}\right), 2.20-2.02(2 \mathrm{H}, \mathrm{m}, \mathrm{OCHCHH}$ and $\mathrm{CHMe} 2), 1.74-1.60(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{C} H \mathrm{HCHH}), 1.50-1.31\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CHMe}\right), 1.31-$ 1.19 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{C} H^{\mathrm{i}} \mathrm{Pr}$ ), 1.12-0.80 (3H, m, OCHCHH, CH(Me)CHHCHH), $0.94(3 \mathrm{H}, \mathrm{d}, J$ 6.6, $\left.\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.87(3 \mathrm{H}, \mathrm{d}, J 7.1)$ and $0.80\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 170.8(\mathrm{C}=\mathrm{O}), 150.9(\mathrm{C}=\mathrm{CHCH}), 124.8(\mathrm{O}=\mathrm{CCH}), 100.5(\mathrm{OCHO}), 79.1$ $\left(\mathrm{OCHCH}_{2}\right), 47.7\left(\mathrm{CH}^{\mathrm{i}} \mathrm{Pr}\right), 40.3\left(\mathrm{OCHCH}_{2}\right), 34.2\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 31.5\left(\mathrm{CHMe}_{2}\right)$, $25.3\left(\mathrm{CH}_{2} \mathrm{CHMe}\right)$, $23.1\left({ }^{\mathrm{i}} \mathrm{PrCHCH} 2\right), 22.2,20.9\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $15.6\left(\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right)$.

Procedure for removal of menthyl 3-formylacrylate when it was produced as major side product in the reaction:

The crude oil was dissolved in ether and washed with saturated sodium hydrogensulfite. Organic materials from the aqueous phase were extracted with ether, and the combined organic layers were washed with brine and dried $\left(\mathrm{MgSO}_{4}\right)$ to give a yellow oil which solidified overnight. A hot filtration in PS $\left(40-60{ }^{\circ} \mathrm{C}\right)$, followed by concentration
afforded a 1:1 diastereoisomeric mixture of the menthyloxybutenolides as an orange solid which could be separated by recrystallisations from PS.

## 2-Trimethylsilyloxy-1,3-butadiene (198) ${ }^{161}$

A 3-necked flask equipped with 2 addition funnels and a reflux condenser was charged with $\mathrm{Et}_{3} \mathrm{~N}(24.1 \mathrm{~mL}, 173 \mathrm{mmol})$ and $\operatorname{DMF}(80 \mathrm{~mL})$, and heated to $90^{\circ} \mathrm{C}$. MVK $(12 \mathrm{~mL}$, 147 mmol ) in DMF ( 10 mL ) and TMSCl ( $21.7 \mathrm{~mL}, 171 \mathrm{mmol}$ ) in DMF ( 10 mL ) were added simultaneously to the reaction over 30 min . The suspension was stirred at $90^{\circ} \mathrm{C}$ for 16 h , then cooled to room temperature and filtered. The filtrate was diluted with pentane ( 120 mL ) and washed with cold $5 \%$ aqueous $\mathrm{NaHCO}_{3}(400 \mathrm{~mL})$. The organic materials were extracted from the aqueous layer with pentane $(2 \times 120 \mathrm{~mL})$ and the combined organic extracts were washed with cold $\mathrm{H}_{2} \mathrm{O}(80 \mathrm{~mL})$ and then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Pentane and other volatiles were removed by fractional distillation at atmospheric pressure before the product was distilled through a 10 cm Vigreux column to afford the title diene $\mathbf{1 9 8}^{161}(6.86 \mathrm{~g}, 33 \%)$ as a colourless liquid; b.p. $40-43{ }^{\circ} \mathrm{C} / 40$ $\mathrm{mmHg}\left[\right.$ lit. $\left.{ }^{161} 50-55^{\circ} \mathrm{C} / 50 \mathrm{mmHg}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.19(1 \mathrm{H}$, dd, J $17.0,10.5$, $\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{C} H\right), 5.47(1 \mathrm{H}$, br d, $J 17.0)$ and $5.08\left(1 \mathrm{H}\right.$, br d, $\left.J 10.5, \mathrm{HC}=\mathrm{CH}_{2}\right), 4.35(1 \mathrm{H}, \mathrm{s})$ and $4.34\left(1 \mathrm{H}, \mathrm{s},(\mathrm{TMSO}) \mathrm{C}=\mathrm{CH}_{2}\right), 0.23\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 154.9$ $((\mathrm{TMSO}) C), 134.7 \quad\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), \quad 114.5 \quad\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), \quad 96.3 \quad\left((\mathrm{TMSO}) \mathrm{C}=\mathrm{CH}_{2}\right), 0.0$ $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right)$.

## 1,3,3-Trimethoxybutane (201) ${ }^{71}$

To methyl vinyl ketone ( $200 \mathrm{~mL}, 2.44 \mathrm{~mol}$ ) in MeOH ( $300 \mathrm{~mL}, 7.33 \mathrm{~mol}$ ) were added trimethyl orthoformate ( $446 \mathrm{~mL}, 4.08 \mathrm{~mol}$ ), followed by $p$-toluenesulfonic acid monohydrate ( $270 \mathrm{mg}, 1.4 \mathrm{mmol}$ ). Over the next 5 min the reaction became exothermic and dark brown in colour. The reaction mixture was allowed to stand at room temperature for $12 \mathrm{~d} . \mathrm{Na}_{2} \mathrm{CO}_{3}(4.92 \mathrm{~g}, 46.4 \mathrm{mmol})$ was added and the resulting deep red
coloured solution was stirred for 3 d . The solids were filtered and excess methanol and other volatiles were removed by distillation at atmospheric pressure (maintaining the head temperature below $70{ }^{\circ} \mathrm{C}$ ). The resulting mixture was filtered and purified by distillation under reduced pressure to afford 1,3,3-trimethoxybutane ( $285 \mathrm{~g}, 79 \%$ ) as a colourless liquid; b.p. $59-60^{\circ} \mathrm{C} / 18 \mathrm{mmHg}$ [lit. $\left.{ }^{71} 57-58{ }^{\circ} \mathrm{C} / 18 \mathrm{mmHg}\right] ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 3.40\left(2 \mathrm{H}, \mathrm{t}, J 7.2, \mathrm{CH}_{2} \mathrm{OMe}\right), 3.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OCH}_{3}\right), 3.15\left(6 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right)$, $1.91\left(2 \mathrm{H}, \mathrm{t}, J 7.2, \mathrm{C}(\mathrm{OMe})_{2} \mathrm{CH}_{2}\right), 1.24\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}(\mathrm{OMe})_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $100.5\left(C(\mathrm{OMe})_{2}\right), 68.9\left(\mathrm{CH}_{2} \mathrm{OMe}\right), 58.6\left(\mathrm{CH}_{2} \mathrm{OCH}_{3}\right), 48.0\left(\mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right), 36.3$ $\left(\mathrm{C}(\mathrm{OMe})_{2} \mathrm{CH}_{2}\right), 21.5\left(\mathrm{C}(\mathrm{OMe})_{2} \mathrm{CH}_{3}\right)$.

2-Methoxy-1,3-butadiene (202) ${ }^{71}$

To a 100 mL 3-necked flask equipped with a pressure equalising dropping funnel, a 10 cm Vigreux column fitted with a distillation apparatus, and a glass stopper was added $\mathrm{KHSO}_{4}$ ( $61 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and approximately 25 mL of 1,3,3-trimethoxybutane. The flask was lowered into an oil bath preheated to $150{ }^{\circ} \mathrm{C}$, and the remaining 1,3,3trimethoxybutane (total amount $70.0 \mathrm{~mL}, 444 \mathrm{mmol}$ ) was added dropwise at a rate to maintain approximately 25 mL material in the reaction flask. The distilled products were collected in a flask cooled to $-78^{\circ} \mathrm{C}$, and when the rate of distillation appeared to slow down (when head temperature decreased from $63{ }^{\circ} \mathrm{C}$ to $55^{\circ} \mathrm{C}$ ), additional $\mathrm{KHSO}_{4}$ ( $61 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) was added. On completion of the distillation, the colourless distillate was warmed to room temperature and washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$, taking care not to shake the mixture. The organic layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and stored over $4 \AA$ molecular sieves overnight at $4{ }^{\circ} \mathrm{C}$. A small amount of hydroquinone was added and the product was distilled through a 10 cm Vigreux column to afford diene $202(12.6 \mathrm{~g}, 34 \%)$ as a colourless liquid; b.p. $76-77{ }^{\circ} \mathrm{C}\left[\mathrm{lit}^{71} 75{ }^{\circ} \mathrm{C}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.17(1 \mathrm{H}, \mathrm{dd}, J$ 17.3, 10.9, $\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.56(1 \mathrm{H}$, br d, $J 17.3)$ and $5.09\left(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J 10.8, \mathrm{HC=} \mathrm{CH}_{2}\right), 4.16$ $(1 \mathrm{H}, \mathrm{s})$ and $4.13\left(1 \mathrm{H}, \mathrm{s},(\mathrm{OMe}) \mathrm{C}=\mathrm{CH}_{2}\right), 3.63\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 159.1$ $(\mathrm{MeOC}), 133.2\left(\mathrm{CH}_{2} \mathrm{CH}\right), 114.2\left(\mathrm{CH}_{2} \mathrm{CH}\right), 86.5\left(\mathrm{CH}_{2} \mathrm{COMe}\right)$, $54.7\left(\mathrm{OCH}_{3}\right)$.
(3R,3aR,7aS)-3-(L-Menthyloxy)-5-methoxy-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one (203)

Thermal sealed tube:
A stirring solution of furanone $197(1.50 \mathrm{~g}, 6.3 \mathrm{mmol})$ and diene $202(1.32 \mathrm{~g}, 15.7$ $\mathrm{mmol})$ in toluene ( 2 mL ) was heated in a sealed tube for 7 d at $120^{\circ} \mathrm{C}$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{PS} \rightarrow \mathrm{EtOAc}: \mathrm{PS} 1: 19\right)$ afforded adduct $203(1.07 \mathrm{~g}, 53 \%)$ as a white solid.

Microwave sealed tube:
A stirring solution of furanone $(1.50 \mathrm{~g}, 6.3 \mathrm{mmol})$ and diene $(1.32 \mathrm{~g}, 15.7 \mathrm{mmol})$ in toluene ( 2 mL ) was treated with microwave radiation while heated in a sealed tube at $180{ }^{\circ} \mathrm{C}$ for 2 h . Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; PS $\rightarrow$ EtOAc:PS 1:19) afforded adduct $\mathbf{2 0 3}^{70}(1.41 \mathrm{~g}, 70 \%)$ as a white solid; m.p. 115$116{ }^{\circ} \mathrm{C}\left[\right.$ lit. $\left.{ }^{70} 129.5-130.5^{\circ} \mathrm{C}\right] ;[\alpha]_{D}^{20}-130.4\left(\mathrm{CHCl}_{3}, \mathrm{c} 1.0\right) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.28$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 4.51(1 \mathrm{H}, \mathrm{br} \mathrm{s},(\mathrm{MeO}) \mathrm{C}=\mathrm{CH}), 3.58-3.46\left(1 \mathrm{H}, \mathrm{m}, \mathrm{OCHCH}_{2}\right), 3.50(3 \mathrm{H}$, s, $\left.\mathrm{OCH}_{3}\right), 3.09-2.96(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}$ and $\mathrm{O}=\mathrm{CCH}), 2.28-2.05(3 \mathrm{H}, \mathrm{m}$, $\mathrm{O}=\mathrm{CCHCH}_{2}$ and OCHCHH$), 2.05-1.88\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CHMe}_{2}\right.$ and $\left.(\mathrm{MeO}) \mathrm{CCHH}\right), 1.87-1.72$ $(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO}) \mathrm{CCH} H), 1.72-1.57(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{CHHCHH}), 1.47-1.29(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CHMe}\right), \quad 1.29-1.14\left(1 \mathrm{H}, \quad \mathrm{m}, \quad \mathrm{C} H^{\mathrm{i}} \mathrm{Pr}\right), \quad 1.10-0.81 \quad(3 \mathrm{H}, \quad \mathrm{m}, \quad$ ОСНСН $H$, $\mathrm{CH}(\mathrm{Me}) \mathrm{CH} H \mathrm{CH} H), 0.93\left(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.86(3 \mathrm{H}, \mathrm{d}, J 7.0)$ and $0.76(3 \mathrm{H}$, d, $\left.J 7.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.2(\mathrm{C}=\mathrm{O}), 158.2((\mathrm{MeO}) C=\mathrm{CH}), 103.9$ ( OCHO ), $90.0((\mathrm{MeO}) \mathrm{C}=\mathrm{CH}), 76.2\left(\mathrm{OCHCH}_{2}\right), 54.1\left(\mathrm{OCH}_{3}\right), 47.8\left(\mathrm{CH}^{\mathrm{i}} \mathrm{Pr}\right), 41.8$ $(\mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), 39.8\left(\mathrm{OCHCH}_{2}\right), 36.7(\mathrm{O}=\mathrm{CCH}), 34.3\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 31.4$ $\left(\mathrm{CHMe}_{2}\right), 25.6\left(\mathrm{CH}_{2} \mathrm{CHMe}\right), 23.9\left((\mathrm{MeO}) \mathrm{CCH}_{2}\right), 23.1\left({ }^{\mathrm{i}} \mathrm{PrCHCH}_{2}\right), 22.3$ and 20.9 $\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 20.1\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 15.6\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)\right)$.

Methyl [(2R,3R,4S)-2-(L-menthyloxy)-5-oxo-4-(2-oxoethyl)tetrahydrofuran-3-yl]acetate (204)

Through a stirring solution of methoxy-alkene $203(0.30 \mathrm{~g}, 0.93 \mathrm{mmol})$ and Sudan Red ( $0.01 \%$ in $\mathrm{MeOH} \mathrm{w} / \mathrm{v}, 0.1 \mathrm{~mL}$ ) in $\mathrm{DCM}(10 \mathrm{~mL})$ was bubbled ozone in $\mathrm{O}_{2}$ at $-78^{\circ} \mathrm{C}$. When the solution was decolourised, argon was flushed through the system for 20 min . DMS ( $0.43 \mathrm{~mL}, 5.9 \mathrm{mmol}$ ) was added and the solution stirred for 18 h under argon, gradually warming up to room temperature. DCM and excess DMS were removed in vacuo, and to the remaining oil was added EtOAc $(20 \mathrm{~mL})$. The resulting solution was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$, brine $(3 \times 20 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Filtration, concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:9 $\rightarrow 3: 17$ ) afforded cleaved product $204(0.10 \mathrm{~g}, 30 \%)$ as a white solid; m.p. $101-103{ }^{\circ} \mathrm{C}$; $[\alpha]_{D}^{20}$ $-63.7\left(\mathrm{CHCl}_{3}\right.$, c 1.0); $v_{\text {max }} / \mathrm{cm}^{-1}(\mathrm{KBr}) 2953,2868(\mathrm{CH}), 1772,1730(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}(500$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.80(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 5.48(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 3.67\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.59-3.48$ $(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), 3.47-3.44\left(1 \mathrm{H}, \mathrm{m}, \mathrm{OCHCH}_{2}\right), 3.02(1 \mathrm{H}, \mathrm{dd}, J 19.1,4.9$, ОНСС $H \mathrm{H}$ ), 2.98-2.94 (1H, m, O=CCH), 2.61 ( 1 H , ddd, J 19.0, 9.6, 0.8, ОНССН $H$ ), $2.26(1 \mathrm{H}, \mathrm{dd}, J 16.5,5.9)$ and $2.20\left(1 \mathrm{H}, \mathrm{dd}, J 16.5,9.4, \mathrm{MeO}_{2} \mathrm{CCH}_{2}\right), 2.06-2.03(1 \mathrm{H}, \mathrm{m}$, ОСНСНН), 2.03-1.99 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHMe}_{2}$ ), 1.65-1.60 ( $\left.2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{CHHCHH}\right), 1.39-$ $1.30\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CHMe}\right), 1.28-1.19\left(1 \mathrm{H}, \mathrm{m}, \mathrm{C} H^{\mathrm{i}} \mathrm{Pr}\right), 0.98-0.95(1 \mathrm{H}, \mathrm{m}, \mathrm{OCHCH} H)$, 0.91 (3H, d, J 6.6, $\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)$ ), 0.91-0.80 (2H, m, CH(Me)CHHCHH), 0.85 (3H, d, J 7.1) and $0.73\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 198.7(\mathrm{CHO}), 176.9$ $(\mathrm{O}=\mathrm{COCH}), 171.2\left(\mathrm{CO}_{2} \mathrm{Me}\right), 102.8(\mathrm{OCHO}), 77.0\left(\mathrm{OCHCH}_{2}\right), 52.1\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right), 47.6$ $\left(C H^{i} \mathrm{Pr}\right), 40.9(\mathrm{O}=\mathrm{CCH}), 39.7\left(\mathrm{OHCCH}_{2}\right), 39.6\left(\mathrm{OCHCH}_{2}\right), 36.1(\mathrm{OCH}(\mathrm{OMen}) C \mathrm{H})$, $34.2\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 31.7\left(\mathrm{MeO}_{2} \mathrm{CCH}_{2}\right), 31.3(\mathrm{CHMe} 2), 25.5\left(\mathrm{CH}_{2} \mathrm{CHMe}\right), 22.9$ $\left.{ }^{\mathrm{i}} \mathrm{PrCHCH}_{2}\right), 22.2$ and $20.9\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 15.4\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)\right) ; m / z(\mathrm{CI}+) 355\left(\mathrm{MH}^{+}, 5 \%\right)$, 217 (32), 199 (100), 181 (22), 153 (24), 139 (59), 83 (57); HRMS (CI+) calcd for $\mathrm{C}_{19} \mathrm{H}_{31} \mathrm{O}_{6}\left(\mathrm{MH}^{+}\right) 355.2121$, found 355.2123 .
(3R,3aR,7aS)-3-(L-Menthyloxy)-5-methyl-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one (208a) and (3R,3aR,7aS)-3-(L-Menthyloxy)-6-methyl-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one (208b)

A stirring solution of furanone $197(1.00 \mathrm{~g}, 8.8 \mathrm{mmol})$ and isoprene $(2.1 \mathrm{~mL}, 210$ mmol ) in toluene ( 2 mL ) was treated with microwave radiation at $160{ }^{\circ} \mathrm{C}$ for 2 h . Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:19) afforded an inseparable $1: 1$ mixture of the olefin regioisomers 208a and 208b $(1.17 \mathrm{~g}$, $91 \%)$ as a white solid; m.p. $65-69{ }^{\circ} \mathrm{C}\left[\right.$ lit. $\left.{ }^{67} 68-74{ }^{\circ} \mathrm{C}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.46-5.40$ $(0.5 \mathrm{H}, \mathrm{m})$ and $5.40-5.34(0.5 \mathrm{H}, \mathrm{m}, \mathrm{MeC}=\mathrm{CH}), 5.32-5.25(1 \mathrm{H}, \mathrm{m}, \mathrm{OCHO}), 3.51(0.5 \mathrm{H}$, $\mathrm{dt}, J 10.6,1.6)$ and $3.50\left(0.5 \mathrm{H}, \mathrm{dt}, J 10.6,1.6, \mathrm{OCHCH}_{2}\right), 3.10(0.5 \mathrm{H}, \mathrm{dt}, J 7.9,2.1)$ and $3.02(1 \mathrm{H}, J 7.9,2.1, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), 2.58-2.31(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}$ and $\mathrm{O}=\mathrm{CCHCHH})$, 2.31-2.17 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH} H), 2.17-1.92(3 \mathrm{H}, \mathrm{m}, \mathrm{OCHCHH}, \mathrm{CHMe} 2$ and $\mathrm{OCH}(\mathrm{OMen}) \mathrm{CHCHH}), 1.90-1.74(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CHCH} H), 1.69(1.5 \mathrm{H}, \mathrm{s})$ and $1.66\left(1.5 \mathrm{H}, \mathrm{s}, \mathrm{HC}=\mathrm{CCH}_{3}\right), 1.63-1.52(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{C} H \mathrm{HCHH}), 1.47-1.29(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CHMe}\right), \quad 1.29-1.15\left(1 \mathrm{H}, \quad \mathrm{m}, \quad \mathrm{C} H^{\mathrm{i}} \mathrm{Pr}\right), \quad 1.08-0.79 \quad(3 \mathrm{H}, \quad \mathrm{m}, \quad$ ОСНСН $H$, $\mathrm{CH}(\mathrm{Me}) \mathrm{CH} H \mathrm{CH} H), 0.93\left(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.87(3 \mathrm{H}, \mathrm{d}, J 7.0)$ and $0.76(3 \mathrm{H}$, $\left.\mathrm{d}, J 7.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.8(\mathrm{O}=\mathrm{C}), 132.9,131.4(\mathrm{HC=CMe})$, 119.2, $118.2(\mathrm{MeC}=\mathrm{CH}), 103.6(\mathrm{OCHO}), 76.4\left(\mathrm{OCHCH}_{2}\right), 47.8\left(\mathrm{CH}^{\mathrm{H}} \mathrm{Pr}\right), 39.8$ $\left(\mathrm{OCHCH}_{2}\right), \quad 38.8, \quad 37.8 \quad(\mathrm{O}=\mathrm{CCH}), \quad 36.5, \quad 35.4 \quad(\mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), \quad 34.3$ $\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), \quad 31.4\left(\mathrm{CHMe}_{2}\right), \quad 28.2, \quad 26.4\left(\mathrm{OCH}(\mathrm{OMen}) \mathrm{CHCH}_{2}\right), \quad 25.5$ $\left(\mathrm{CH}_{2} \mathrm{CHMe}\right)$, 23.8, $23.4\left(\mathrm{C}=\mathrm{CCH}_{3}\right), 22.7$, $22.1\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 23.0\left({ }_{( } \mathrm{PrCHCH}_{2}\right), 22.3$, $21.0\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $15.5\left(\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right)$.

2-[(3S,4R,5R)-5-(L-Menthyloxy)-2-oxo-4-(2-oxopropyl)tetrahydrofuran-3yl]acetaldehyde (209a) and 2-[(3S,4R,5R)-5-(L-Menthyloxy)-2-oxo-3-(2-oxopropyl)tetrahydrofuran-3-yl]acetaldehyde (209b)

Through a stirring solution of olefins $208(0.30 \mathrm{~g}, 0.98 \mathrm{mmol})$ in $\mathrm{DCM}(10 \mathrm{~mL})$ was bubbled ozone in $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$. When the solution became blue, oxygen was bubbled through the solution until it was colourless. $\mathrm{PPh}_{3}(0.51 \mathrm{~g}, 2.0 \mathrm{mmol})$ was added and the solution stirred overnight under argon, slowing warming up to room temperature. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{EtOAc}: P S$ 2:3) afforded an inseparable 7:3 mixture of the two regioisomers 209a and 209b ( $0.13 \mathrm{~g}, 38 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2924, $2870(\mathrm{CH}), 1770,1717(\mathrm{C}=\mathrm{O})$; $\delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 9.78(0.3 \mathrm{H}, \mathrm{s})$ and $9.72\left(0.7 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CHO}\right), 5.36(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 3.52-3.39$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}\right.$ and $\left.\mathrm{OCHCH}_{2}\right), 3.11-3.03(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}), 3.00(1 \mathrm{H}, \mathrm{dd}, J$ $18.8,4.5)$ and $2.51\left(1 \mathrm{H}, \mathrm{dd}, J 18.7,9.8, \mathrm{OHCCH}_{2}\right), 2.41-2.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{MeOCCH}_{2}\right), 2.19$ $(2.1 \mathrm{H}, \mathrm{s})$ and $2.16\left(0.9 \mathrm{H}, \mathrm{s}, \mathrm{COCH}_{3}\right), 2.12-1.93(2 \mathrm{H}, \mathrm{m}, \mathrm{OCHCHH}$ and CHMe 2$), 1.75-$ $1.55\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{CHHCH}_{2}\right.$ and $\left.{ }^{\mathrm{i}} \mathrm{PrCHCHH}\right), 1.45-1.30\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CHMe}\right), 1.30-$ $1.15\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}{ }^{\mathrm{i}} \mathrm{Pr}\right), 1.05-0.76\left(3 \mathrm{H}, \mathrm{m}, \mathrm{OCHCHH}, \mathrm{CH}(\mathrm{Me}) \mathrm{CHHCH}_{2}\right.$ and $\left.{ }^{\mathrm{i}} \mathrm{PrCHCH} H\right)$, $0.92\left(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.86(3 \mathrm{H}, \mathrm{d}, J 7.1)$ and $0.72\left(3 \mathrm{H}, \mathrm{d}, J 7.1, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 205.5,205.4\left(\mathrm{CH}_{2} \mathrm{CHO}\right), 199.0$, 198.2 ( COMe ), 177.3, 171.1 $(\mathrm{O}=\mathrm{COCH}), 103.1,102.9(\mathrm{OCHO}), 77.3,76.6\left(\mathrm{OCHCH}_{2}\right), 47.6\left(\mathrm{CH}^{\mathrm{i}} \mathrm{Pr}\right), 41.5,40.6$ $(\mathrm{O}=\mathrm{CCH}), 40.0,39.6,39.5,38.9\left(2 \times \mathrm{O}=\mathrm{CCH}_{2}\right), 39.8\left(\mathrm{OCHCH}_{2}\right), 37.2,36.0$ ( $\mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), 34.3\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 31.4\left(\mathrm{CHMe}_{2}\right), 30.1,29.9\left(\mathrm{COCH}_{3}\right), 25.5$ $\left(\mathrm{CH}_{2} C \mathrm{HMe}\right)$, $23.0\left({ }^{\mathrm{i}} \mathrm{PrCHCH}_{2}\right)$, 22.2, $20.9\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 15.5\left(\mathrm{H}_{2} \mathrm{CCH}\left(\mathrm{CH}_{3}\right)\right) ; m / z(\mathrm{CI}+)$ 339 ( $\mathrm{MH}^{+}, 5 \%$ ), 201 (15), 183 (100), 165 (47), 139 (32); HRMS (CI+) calcd for $\mathrm{C}_{19} \mathrm{H}_{31} \mathrm{O}_{5}\left(\mathrm{MH}^{+}\right) 339.2171$, found 339.2174 .

A stirring solution of menthyloxy-furanones $208(0.20 \mathrm{~g}, 0.65 \mathrm{mmol})$ and $p-\mathrm{TsOH}$ ( 6 $\mathrm{mg}, 30 \mu \mathrm{~mol}$ ) in $\mathrm{MeOH}(28 \mathrm{~mL}$ ) was heated at reflux for 3 h . MeOH was removed in vacuo and the remaining residue was diluted with EtOAc $(30 \mathrm{~mL})$. The solution was washed with saturated $\mathrm{NaHCO}_{3}(2 \times 30 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(2 \times 30 \mathrm{~mL})$, brine $(2 \times 30 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$;
$\mathrm{DCM} \rightarrow \mathrm{MeOH}: \mathrm{DCM} 1: 49)$ afforded an inseparable $1: 1$ mixture of the two methoxyfuranone regioisomers 210a and $210 \mathrm{~b}(0.03 \mathrm{~g}, 25 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2919, $2845(\mathrm{CH}), 1770(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.46-5.40(0.5 \mathrm{H}, \mathrm{m})$ and $5.40-$ $5.34(0.5 \mathrm{H}, \mathrm{m}, \mathrm{MeC}=\mathrm{C} H), 4.99(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 3.48(1.5 \mathrm{H}, \mathrm{s})$ and $3.47(1.5 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.07(0.5 \mathrm{H}, \mathrm{td}, J 8.0,2.1)$ and $2.99(0.5 \mathrm{H}, \mathrm{td}, J 8.0,2.1, \mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 2.65-$ $2.48(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}), 2.44(1 \mathrm{H}, \mathrm{t} J 8.0, \mathrm{O}=\mathrm{CCHCHH}), 2.39-2.14(2 \mathrm{H}, \mathrm{m}$, $\mathrm{O}=\mathrm{CCHCHH}$ and $\mathrm{OCH}(\mathrm{OMe}) \mathrm{CHCHH}), 1.91-1.71(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMe}) \mathrm{CHCH} H), 1.68$ (1.5 H, s) and $1.66\left(1.5 \mathrm{H}, \mathrm{s}, \mathrm{HC}=\mathrm{C}\left(\mathrm{CH}_{3}\right)\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.8(\mathrm{C}=\mathrm{O}), 133.2$, $131.6(\mathrm{HC}=\mathrm{CMe}), 119.3,118.2(\mathrm{MeC}=\mathrm{CH}), 108.6(\mathrm{OCHO}), 56.7\left(\mathrm{OCH}_{3}\right), 38.6,37.7$ $(\mathrm{O}=\mathrm{CCH}), 36.3,35.2(\mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 28.3,26.4\left(\mathrm{OCH}(\mathrm{OMe}) \mathrm{CHCH}_{2}\right), 23.9,22.1$ $\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 23.7,23.4\left(\mathrm{HC}=\mathrm{CCH}_{3}\right) ; m / z(\mathrm{CI}+) 183\left(\mathrm{MH}^{+}, 28 \%\right), 168(10), 151(40)$, 137 (10), 122 (31), 105 (54), 93 (100); HRMS (CI+) calcd for $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{3}\left(\mathrm{MH}^{+}\right)$ 183.1021, found 183.1022 .
(3S,3'R)-1-Benzyl-3-(1-benzyl-5-oxopyrrolidin-3-yl)pyrrolidin-2-one (215)

$\mathrm{NH}_{2} \mathrm{Bn}$ (apparently $0.01 \mathrm{~mL}, 0.09 \mathrm{mmol}$ ) was added dropwise to a solution of aldehyde $204(0.030 \mathrm{~g}, 0.08 \mathrm{mmol})$ in isopropanol $(1.5 \mathrm{~mL})$ and stirred at room temperature for 1 h. The reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and was added a solution of $\mathrm{NaBH}_{3} \mathrm{CN}$ $(0.021 \mathrm{~g}, 0.34 \mathrm{mmol})$ and $\mathrm{ZnCl}_{2}(0.023 \mathrm{~g}, 0.17 \mathrm{mmol})$ in isopropanol $(0.5 \mathrm{~mL})$. The stirring reaction was maintained at $0{ }^{\circ} \mathrm{C}$, and then allowed to stand for 19 h while warming to room temperature. The suspension was then stirred for a further 2 h and the solvent removed in vacuo. The remaining material was dissolved in EtOAc ( 10 mL ) and washed with saturated $\mathrm{NaHCO}_{3}(2 \times 10 \mathrm{~mL})$, brine $(2 \times 10 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{DCM} \rightarrow \mathrm{MeOH}: \mathrm{DCM}$ 1:49) afforded lactam $215(0.026 \mathrm{~g}, 90 \%)$ as a white solid; m.p. $72-74{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}$ $\left(\mathrm{CDCl}_{3}\right.$ cast) $2361(\mathrm{CH}), 1665(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 7.29-7.13 ( $10 \mathrm{H}, \mathrm{m}, 10 \times$ ArH), 4.50-4.31 ( $\left.4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{Ph}\right), 3.33(1 \mathrm{H}, \mathrm{dd}, J 10.0,8.3, \mathrm{NCHHCH}), 3.10(1 \mathrm{H}$, $\left.\mathrm{dt}, J 9.8,8.2, \mathrm{NCHHCH}_{2}\right), 3.01(1 \mathrm{H}, \mathrm{dt}, J 9.1,2.7)$ and $3.03-2.99\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right.$ and NCHHCH$), 2.76-2.70\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CHCHH}\right), 2.57(1 \mathrm{H}, \mathrm{dt}, J 9.2,6.0$,

## Diethyl 1,4-dihydro-2,6-dimethylpyridine-3,5-dicarboxylate (216) ${ }^{162}$

A stirring mixture of formaldehyde ( $37 \%$ in solution, $2.00 \mathrm{~g}, 49 \mathrm{mmol}$ ), ethyl acetoacetate ( $6.40 \mathrm{~g}, 67 \mathrm{mmol}$ ) and ammonium acetate $(2.85 \mathrm{~g}, 37 \mathrm{mmol})$ were heated at $80{ }^{\circ} \mathrm{C}$ for 45 min . The bright yellow suspension was cooled to $0{ }^{\circ} \mathrm{C}$ and filtered, washing with $\mathrm{H}_{2} \mathrm{O}(4 \times 10 \mathrm{~mL})$ and dried under vacuum on the filter. The collected solids were dissolved in hot EtOAc and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. A hot filtration followed by recrystallisation from EtOAc afforded Hantzsch's base $\mathbf{2 1 6}^{163}$ ( $5.12 \mathrm{~g}, 82 \%$ ) as yellow needles; m.p. $176-179{ }^{\circ} \mathrm{C}\left[\right.$ lit. $\left.{ }^{163} 176-178{ }^{\circ} \mathrm{C}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.11(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{NH}), 4.15\left(4 \mathrm{H}, \mathrm{q}, J 7.1,2 \times \mathrm{OCH}_{2}\right), 3.25\left(2 \mathrm{H}, \mathrm{s}, \mathrm{C}=\mathrm{CCH}_{2}\right), 2.18\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{C}=\mathrm{CCH}_{3}\right)$, $1.27\left(6 \mathrm{H}, \mathrm{t}, J 7.1,2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 168.1(2 \times \mathrm{C}=\mathrm{O}), 144.9(2 \times$ $\left.\mathrm{CCO}_{2} \mathrm{Et}\right), 99.5(2 \times \mathrm{NHC}), 59.7\left(2 \times \mathrm{OCH}_{2}\right), 24.8\left(\mathrm{C}=\mathrm{CCH}_{2}\right), 19.2\left(2 \times \mathrm{C}=\mathrm{CCH}_{3}\right), 14.5$ $\left(2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$.

## (3R,3aR,7aS)-Hexahydro-3,5,5-trimethoxyisobenzofuran-1(3H)-one (217) ${ }^{67}$

A stirring mixture of menthyloxy-furanone $203(0.10 \mathrm{~g}, 0.31 \mathrm{mmol})$ and $p$ - $\mathrm{TsOH}(3 \mathrm{mg}$, $16 \mu \mathrm{~mol})$ in $\mathrm{MeOH}(14 \mathrm{~mL})$ were heated at reflux for 2 h . MeOH was removed in vacuo and the remaining residue was dissolved in EtOAc ( 20 mL ). The solution was washed with saturated $\mathrm{NaHCO}_{3}(3 \times 20 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(2 \times 20 \mathrm{~mL})$ and brine $(2 \times 20 \mathrm{~mL})$, and then
dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; $\mathrm{PS} \rightarrow \mathrm{EtOAc}: \operatorname{PS} 1: 4)$ afforded dimethyl acetal $217(0.02 \mathrm{~g}, 25 \%)$ as a colourless oil; $v_{\text {max }} / \mathrm{cm}^{-1}$ (film) $2951(\mathrm{CH}), 1780(\mathrm{C}=\mathrm{O})$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.96(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO})$, $3.45\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCHOCH}_{3}\right), 3.18(3 \mathrm{H}, \mathrm{s})$ and $3.15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right), 2.88(1 \mathrm{H}$, br t, $J 6.4$, $\mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 2.53(1 \mathrm{H}, \mathrm{dt}, J$ 12.4, $6.5, \mathrm{O}=\mathrm{CCH}), 2.21-2.06(2 \mathrm{H}, \mathrm{m}$, $\left.(\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}_{2}\right), 1.95-1.84(1 \mathrm{H}, \mathrm{m})$ and $1.83-1.69\left(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}\right), 1.25$ $(1 \mathrm{H}, \mathrm{dt}, J 13.7,4.5)$ and $1.12\left(1 \mathrm{H}, \mathrm{t}, J 12.9, \mathrm{O}=\mathrm{CCHCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 177.9$ $(\mathrm{C}=\mathrm{O}), 107.0(\mathrm{OCHO}), 98.7\left(\mathrm{C}(\mathrm{OMe})_{2}\right)$, $56.6\left(\mathrm{OCHOCH}_{3}\right), 47.8$, $47.6\left(\mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right)$, $40.0 \quad(\mathrm{O}=\mathrm{CCH}), \quad 36.7 \quad(\mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), \quad 31.7 \quad\left((\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}_{2}\right), \quad 28.6$ $\left((\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}\right), 19.5\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right) ; m / z(\mathrm{CI}+) 231\left(\mathrm{MH}^{+}, 21 \%\right), 213(33), 199$ (100), 181 (82), 142 (85), 123 (71), 101 (53); HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{O}_{5}\left(\mathrm{MH}^{+}\right)$ 231.1232, found 231.1220.

## 5-Methoxy-2-(5H)-furanone (218) ${ }^{67}$

A stirring solution of furanone $195(5.00 \mathrm{~g}, 50.0 \mathrm{mmol})$ in $\mathrm{MeOH}(20.0 \mathrm{~mL}, 500 \mathrm{mmol})$ was heated at reflux for 7 d . Excess MeOH was removed in vacuo and the product purified by distillation to afford methoxy-furanone $\mathbf{2 1 8}^{67}(3.76 \mathrm{~g}, 66 \%)$ as a pale yellow liquid; b.p. $54-56{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}$ [lit. $\left.{ }^{67} 70-72{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.20$ ( $1 \mathrm{H}, \mathrm{dd}, J 5.7,1.1, \mathrm{C}=\mathrm{CHCH}), 6.22$ ( $1 \mathrm{H}, \mathrm{dd}, J 5.7,1.2, \mathrm{O}=\mathrm{CCH}$ ), 5.85 ( $1 \mathrm{H}, \mathrm{d}, J 1.2$, $\mathrm{OCHO}), 3.56\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.4(\mathrm{C}=\mathrm{O}), 150.2(\mathrm{C}=\mathrm{CHCH})$, $125.2(\mathrm{O}=\mathrm{CCH}), 104.1(\mathrm{OCHO}), 57.1\left(\mathrm{OCH}_{3}\right)$.

## 3,5-Dimethoxy-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one (219)

A stirring solution of furanone $218(1.00 \mathrm{~g}, 8.8 \mathrm{mmol})$ and diene $202(1.51 \mathrm{~g}, 17.5$ $\mathrm{mmol})$ in toluene ( 2 mL ) was treated with microwave radiation at $180^{\circ} \mathrm{C}$ for 1 h .

Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{EtOAc}: P S$ 1:9) afforded adduct 219 ( $0.78 \mathrm{~g}, 45 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2919, 2848 (CH), 1722 $(\mathrm{C}=\mathrm{O}), 1661(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.99(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 4.50(1 \mathrm{H}, \mathrm{dd}, J 3.1$, 2.0, $(\mathrm{MeO}) \mathrm{C}=\mathrm{CH}), 3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{HC}=\mathrm{C}\left(\mathrm{OCH}_{3}\right)\right), 3.47\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCHOCH}_{3}\right), 3.06-3.02$ $(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 3.00-2.96(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}), 2.23-2.14(1 \mathrm{H}, \mathrm{m})$ and 2.13-2.05 $\left(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO}) \mathrm{C}=\mathrm{CHCH}_{2}\right), 1.94(1 \mathrm{H}, \mathrm{dd}, J 16.9,5.8)$ and $1.82-1.73(1 \mathrm{H}, \mathrm{m}$, $\left.(\mathrm{MeO}) \mathrm{CCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.1(\mathrm{C}=\mathrm{O}), 158.3(\mathrm{HC}=C(\mathrm{OMe})), 108.9(\mathrm{OCHO})$, $89.8((\mathrm{MeO}) \mathrm{C}=\mathrm{CH}), 56.6\left(\mathrm{OCH}\left(\mathrm{OCH}_{3}\right)\right), 54.1\left(\mathrm{HC}=\mathrm{C}\left(\mathrm{OCH}_{3}\right)\right), 41.5(\mathrm{O}=\mathrm{CCH}), 36.4$ $(\mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 23.8\left((\mathrm{OMe}) \mathrm{CCH}_{2}\right), 20.1\left(\mathrm{C}=\mathrm{CHCH}_{2}\right) ; m / z(\mathrm{CI}+) 200\left(\mathrm{MH}^{+}, 9 \%\right)$, 167 (10), 153 (14), 123 (13), 85 (100); HRMS (CI+) calcd for $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{4}\left(\mathrm{MH}^{+}\right)$requires 199.0970, found 199.0971.

## Methyl [2-Methoxy-5-oxo-4-(2-oxoethyl)tetrahydrofuran-3-yl]acetate (220)

Through a stirring solution of enol ether $219(0.34 \mathrm{~g}, 1.72 \mathrm{mmol})$ in DCM ( 10 mL ) was bubbled ozone in $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$. When the solution became blue, oxygen was passed through the solution until it was colourless. DMS ( $0.25 \mathrm{~mL}, 3.4 \mathrm{mmol}$ ) was added and the mixture stirred for 16 h under argon, gradually warming up to room temperature. The volatiles were removed in vacuo, and to the remaining oil was added EtOAc (10 $\mathrm{mL})$. The solution was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 10 \mathrm{~mL})$, brine $(3 \times 10 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; EtOAc:PS 2:3) afforded a 1:3 diastereoisomeric mixture of impure ester $220(0.03 \mathrm{~g},<8 \%)$ as a colourless oil; diagnostic peaks are quoted: $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.81(0.75 \mathrm{H}, \mathrm{s})$ and $9.78\left(0.25 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CHO}\right), 5.21(0.75 \mathrm{H}, \mathrm{s})$ and $5.09(0.25 \mathrm{H}, \mathrm{s}, \mathrm{OCHO}), 3.71(0.75 \mathrm{H}, \mathrm{s})$ and $3.70\left(2.25 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.58-3.41(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 3.49(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}\left(\mathrm{OCH}_{3}\right)\right), 3.07-2.96(2 \mathrm{H}, \mathrm{m}, \mathrm{OHCCHH}$ and $\mathrm{O}=\mathrm{CCH}), 2.70-2.53(1 \mathrm{H}, \mathrm{m}$, $\mathrm{OHCCH} H), 2.33-2.15\left(2 \mathrm{H}, \mathrm{m}, \mathrm{MeO}_{2} \mathrm{CCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 198.6,198.5$ $\left(\mathrm{CH}_{2} \mathrm{CHO}\right), 176.8(\mathrm{O}=\mathrm{COCH}), 171.2\left(\mathrm{CO}_{2} \mathrm{Me}\right), 107.2,107.1(\mathrm{OCHO}), 56.8$ $\left(\mathrm{OCH}\left(\mathrm{OCH}_{3}\right)\right), 52.2\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right), 40.7(\mathrm{O}=\mathrm{CCH}), 39.6,37.7\left(\mathrm{OHCCH}_{2}\right), 37.7,35.7$ $(\mathrm{OCH}(\mathrm{OMe}) \mathrm{CH}), 31.7,30.2\left(\mathrm{MeO}_{2} \mathrm{CCH}_{2}\right) ; m / z(\mathrm{EI}) 215\left(\mathrm{M}^{+}-\mathrm{Me}, 8 \%\right), 197(28), 184$ (63), 169 (34), 156 (68), 140 (30), 126 (55), 111 (55), 97 (100).

## (3aR,7aS)-5,5-Diethoxyhexahydroisobenzofuran-1(3H)-one (225) ${ }^{76}$

To a stirring solution of menthyloxy-furanone 203 ( $0.15 \mathrm{~g}, 0.47 \mathrm{mmol}$ ) in EtOH ( 10 $\mathrm{mL})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{NaBH}_{4}(0.12 \mathrm{~g}, 3.0 \mathrm{mmol})$ slowly, followed by the dropwise addition of an ethanolic solution of $\mathrm{KOH}(1 \mathrm{M}, 0.8 \mathrm{~mL}, 0.8 \mathrm{mmol})$. The temperature was maintained at $0{ }^{\circ} \mathrm{C}$ for 3 h then the reaction was warmed to room temperature and acidified to pH 3 with 2 M HCl . Dilution with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ was followed by extractions with DCM ( $3 \times 20 \mathrm{~mL}$ ), and the combined organic extracts were stirred at room temperature for 60 h . After concentration, the crude product was dissolved in DCM ( 50 mL ), washed with brine $(3 \times 40 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 9 \rightarrow 3: 17$ ) afforded diethyl acetal $225(0.04 \mathrm{~g}, 39 \%)$ as a colourless oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.22(1 \mathrm{H}, \mathrm{dd}, J 8.9$, 4.6) and $3.97\left(1 \mathrm{H}, \mathrm{d}, J 8.9, \mathrm{OCH}_{2} \mathrm{CH}\right), 3.48(2 \mathrm{H}, \mathrm{q}, J 7.2)$ and $3.41(2 \mathrm{H}, \mathrm{q}, J 7.2$, $\left.\mathrm{C}\left(\mathrm{OCH}_{2} \mathrm{Me}\right)_{2}\right), 2.73-2.58\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}\right.$ and $\left.\mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right), 2.20-2.05(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}\right), 1.95-1.84(1 \mathrm{H}, \mathrm{m})$ and $1.84-1.73\left(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right), 1.33(1 \mathrm{H}$, $\mathrm{dt}, J 13.9,3.5)$ and $1.30-1.23\left(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH}_{2}\right), 1.18(3 \mathrm{H}, \mathrm{t}, J 7.2)$ and $1.15(3 \mathrm{H}, \mathrm{t}, J$ $\left.7.2, \mathrm{C}\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 177.9(\mathrm{C}=\mathrm{O}), 98.9\left(\mathrm{C}(\mathrm{OEt})_{2}\right), 71.2$ $\left(\mathrm{OCH}_{2} \mathrm{CH}\right)$, 55.3, $55.2\left(\mathrm{C}\left(\mathrm{OCH}_{2} \mathrm{Me}\right)_{2}\right), 39.0(\mathrm{O}=\mathrm{CCH}), 34.4\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 34.2$ $\left(\mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}\right)$, $29.4\left(\mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right)$, $19.9\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right)$, 15.5, $15.4\left(\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)_{2}\right)$; $\mathrm{m} / \mathrm{z}(\mathrm{CI}+) 228\left(\mathrm{MH}^{+}, 0.4 \%\right), 183$ (47), 155 (43), 85 (100).

Treatment of menthyloxy-furanone 203 with NaOMe and $\mathrm{NaBH}_{4}$ :

To a stirring solution of menthyloxy-furanone $203(0.20 \mathrm{~g}, 0.62 \mathrm{mmol})$ in MeOH (12 $\mathrm{mL})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{NaBH}_{4}(0.031 \mathrm{~g}, 0.81 \mathrm{mmol})$ slowly, followed by the dropwise addition of a solution of NaOMe [prepared by addition of $\mathrm{Na}(0.02 \mathrm{~g}, 0.8 \mathrm{mmol})$ to
$\mathrm{MeOH}(5 \mathrm{~mL})]$. The temperature was maintained at $0^{\circ} \mathrm{C}$ for 10 min then the reaction was allowed to warm to room temperature, and stirred for 80 min before neutralisation with $\mathrm{pH} 7 \mathrm{KH}_{2} \mathrm{PO}_{4} / \mathrm{KOH}$ buffer. After removal of the organic volatiles, EtOAc ( 25 mL ) was added to the mixture and the organic phase was separated. Following two further extractions with EtOAc ( $2 \times 25 \mathrm{~mL}$ ), the combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS}\right.$ $1: 9 \rightarrow 1: 4)$ afforded impure dementhylated furanone $224(0.02 \mathrm{~g},<14 \%)$, dimethyl acetal $226(0.006 \mathrm{~g},<5 \%)$ and ketone $227(0.007 \mathrm{~g},<7 \%)$ as colourless oils.

## 5-Methoxy-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one

See below (229) for characterisation.
(3aR,7aS)-Hexahydro-5,5-dimethoxyisobenzofuran-1(3H)-one (226)
$\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.23(1 \mathrm{H}, \mathrm{dd}, J 8.8,4.6)$ and $3.98\left(1 \mathrm{H}, \mathrm{d}, J 8.9, \mathrm{OCH}_{2} \mathrm{CH}\right), 3.19$ $(3 \mathrm{H}, \mathrm{s})$ and $3.16\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right), 2.72-2.56\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}\right.$ and $\left.\mathrm{OCH}_{2} \mathrm{CH}\right), 2.20-$ $2.13(1 \mathrm{H}, \mathrm{m})$ and $2.13-2.07\left(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}_{2}\right), 1.95-1.84(1 \mathrm{H}, \mathrm{m})$ and $1.84-$ $1.71\left(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right), 1.37-1.29\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $177.9(\mathrm{C}=\mathrm{O}), 99.0\left(\mathrm{C}(\mathrm{OMe})_{2}\right), 71.2\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 47.8,47.6\left(\mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}\right), 38.0(\mathrm{O}=\mathrm{CCH})$, $34.3\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 33.2\left((\mathrm{MeO})_{2} \mathrm{CCH}_{2} \mathrm{CH}_{2}\right), 28.4\left(\mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right), 19.8\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right)$; $\mathrm{m} / \mathrm{z}(\mathrm{CI}+) 200\left(\mathrm{MH}^{+}, 2 \%\right), 169$ (17), 85 (100).
(3aR,7aS)-Tetrahydroisobenzofuran-1,5(3H,6H)-dione (227)
$\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.42(1 \mathrm{H}, \mathrm{dd}, J 9.6,5.9)$ and $4.01\left(1 \mathrm{H}, \mathrm{dd}, J 9.6,2.7, \mathrm{OCH}_{2}\right)$, $3.11-2.98(1 \mathrm{H}, \mathrm{m})$ and $2.97-2.87\left(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}\right.$ and $\left.\mathrm{OCH}_{2} \mathrm{CH}\right), 2.57(1 \mathrm{H}, \mathrm{dd}, J 15.3$, 6.2, $\left.\mathrm{OCH}_{2} \mathrm{CHCHH}\right), 2.46-2.29\left(4 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCHHCH}_{2}\right.$ and $\left.\mathrm{OCH}_{2} \mathrm{CHCHH}\right), 2.25-$ $2.11(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH} H) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 208.8\left(\mathrm{O}=\mathrm{CCH}_{2}\right), 177.9(\mathrm{OC}=\mathrm{O})$, $71.6\left(\mathrm{OCH}_{2}\right), 41.2(\mathrm{O}=\mathrm{CCH}), 38.2\left(\mathrm{OCH}_{2} \mathrm{CHCH}_{2}\right), 37.3\left(\mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}\right), 35.8$ $\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 22.8\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right) ; m / z(\mathrm{CI}+) 155\left(\mathrm{MH}^{+}, 64 \%\right), 127(9), 85(100)$.

Furan-2(5H)-one (228) ${ }^{78}$

A 500 mL 3-necked flask equipped with a glass stopper, reflux condenser and a pressure equalising dropping funnel was successively charged with furfural ( 20.7 mL , $0.25 \mathrm{~mol}), \mathrm{DCM}(100 \mathrm{~mL}), \mathrm{Na}_{2} \mathrm{SO}_{4}(10.0 \mathrm{~g}, 70 \mathrm{mmol})$ and $N$, N -dimethylethanolamine $(8.5 \mathrm{~mL}, 86 \mathrm{mmol})$. Subsequent addition of $\mathrm{HCO}_{2} \mathrm{H}(18.9 \mathrm{~mL}, 0.50 \mathrm{~mol})$ dropwise, followed by addition of $\mathrm{H}_{2} \mathrm{O}_{2}$ ( $30 \%$ aqueous, $5 \mathrm{~mL}, 0.05 \mathrm{mmol}$ ) in one portion led to an exothermic refluxing reaction within 5 min . The suspension was vigorously stirred and stayed exothermic while the remaining $\mathrm{H}_{2} \mathrm{O}_{2}$ ( $30 \%$ aqueous, $40.1 \mathrm{~mL}, 0.39 \mathrm{~mol}$ ) was added at a rate of $10 \mathrm{~mL} / \mathrm{h}$ via a syringe pump. After 16 h , the organic phase was separated and the aqueous phase extracted with DCM $(2 \times 10 \mathrm{~mL})$. The combined organic extracts were washed with saturated sodium sulfite ( $3 \times 10 \mathrm{~mL}$ ) and after a negative $\mathrm{H}_{2} \mathrm{O}_{2}$ test, was dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and distillation of the crude material through a 10 cm Vigreux column afforded the furanone ( 9.83 g ) as a pale yellow oil; b.p. $56-58{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}$ [lit. ${ }^{78} 85^{\circ} \mathrm{C} / 13 \mathrm{mmHg}$ ]. Redistillation removed the remaining traces of high boiling impurities to afford the pure furanone $228(7.58 \mathrm{~g}$, $36 \%$ ) as a colourless oil; b.p. $64-65{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}\left[\right.$ lit. $\left.{ }^{78} 79-81{ }^{\circ} \mathrm{C} / 9 \mathrm{mmHg}\right] ; v_{\max } / \mathrm{cm}^{-1}$ (film) $1776(\mathrm{C}=\mathrm{O}), 1742 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.58\left(1 \mathrm{H}, \mathrm{dt}, J 5.9,1.6, \mathrm{OCH}_{2} \mathrm{CH}\right)$, $6.16(1 \mathrm{H}, \mathrm{dt}, J 5.6,2.1, \mathrm{O}=\mathrm{CCH}), 4.92-4.88\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 173.7$ $(\mathrm{C}=\mathrm{O}), 152.8\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 121.6(\mathrm{O}=\mathrm{CCH}), 72.1\left(\mathrm{OCH}_{2}\right) ; m / z(\mathrm{CI}+) 85\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS (CI+) calcd for $\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}_{2}\left(\mathrm{MH}^{+}\right) 85.0290$, found 85.0289.

## Cis-5-methoxy-3a,4,7,7a-tetrahydro-(3H)-isobenzofuran-1-one (229)

A stirring solution of furanone $228(0.20 \mathrm{~g}, 2.4 \mathrm{mmol})$ and diene $2 \mathbf{2 0 2}(0.40 \mathrm{~g}, 4.8 \mathrm{mmol})$ in toluene ( 1 mL ) was treated with microwave radiation at $180{ }^{\circ} \mathrm{C}$ for 1 h . Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS $1: 19 \rightarrow 3: 17$ ) provided adduct $229(0.09 \mathrm{~g}, 22 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2908, 2850 $(\mathrm{CH}), 1754(\mathrm{O}=\mathrm{C}), 1672(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.59(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{C}=\mathrm{CH}), 4.32-$ $4.28(1 \mathrm{H}, \mathrm{m})$ and $4.01-3.96\left(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right), 3.46\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.78-2.70(2 \mathrm{H}, \mathrm{m}$, $\mathrm{O}=\mathrm{CCH}$ and $\left.\mathrm{OCH}_{2} \mathrm{CH}\right), 2.58-2.50(1 \mathrm{H}, \mathrm{m})$ and $2.42-2.30\left(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO}) \mathrm{C}=\mathrm{CHCH}_{2}\right)$, $2.23(1 \mathrm{H}, \mathrm{dd}, J 16.6,7.4)$ and $1.94\left(1 \mathrm{H}, \mathrm{dd}, J 15.6,5.7\right.$, $\left.(\mathrm{MeO}) \mathrm{CCH}_{2}\right)$; $\delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 179.1(\mathrm{C}=\mathrm{O}), 153.5((\mathrm{MeO}) \mathrm{C}=\mathrm{CH}), 90.7((\mathrm{MeO}) \mathrm{C}=\mathrm{CH})$, $72.5\left(\mathrm{OCH}_{2}\right), 54.1$
$\left(\mathrm{OCH}_{3}\right), 37.6(\mathrm{O}=\mathrm{CCH}), 33.4\left(\mathrm{OCH}_{2} \mathrm{CH}\right), 28.1\left((\mathrm{MeO}) \mathrm{CCH}_{2}\right), 21.5\left((\mathrm{MeO}) \mathrm{C}=\mathrm{CHCH}_{2}\right)$; $\mathrm{m} / \mathrm{z}(\mathrm{CI}+) 169\left(\mathrm{MH}^{+}, 53 \%\right), 91(100), 85(18) ; \mathrm{HRMS}(\mathrm{CI}+)$ calcd for $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{O}_{3}\left(\mathrm{MH}^{+}\right)$ 169.0865 , found 169.0863 .

## Methyl-cis-5-oxo-4-(2-oxoethyl)tetrahydrofuran-3-yl-acetate (230)

Through a solution of enol ether $229(0.05 \mathrm{~g}, 0.30 \mathrm{mmol})$ and Sudan Red $(0.01 \%$ in $\mathrm{MeOH} w / \mathrm{v}, 0.05 \mathrm{~mL}$ ) in DCM ( 2 mL ) was bubbled ozone in $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$. When the solution was decolourised, argon was flushed through the system for 2 min . DMS ( 0.04 $\mathrm{mL}, 0.6 \mathrm{mmol}$ ) was added and the mixture maintained at $-78^{\circ} \mathrm{C}$ for 90 min , before warming to room temperature. After $16 \mathrm{~h}, \mathrm{DCM}$ and other volatiles were removed in vacuo, and to the remaining oil was added EtOAc ( 5 mL ). The solution was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 5 \mathrm{~mL})$, brine $(3 \times 5 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 9 \rightarrow 3: 7$ ) afforded cleaved product $230(0.06 \mathrm{~g}, 10 \%)$ as a colourless oil; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.84(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO})$, $4.42(1 \mathrm{H}, \mathrm{dd}, J 9.6,5.7)$ and $4.21\left(1 \mathrm{H}, \mathrm{dd}, J 9.7,1.8, \mathrm{OCH}_{2} \mathrm{CH}\right), 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 3.29-3.16 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}$ and $\mathrm{O}=\mathrm{CCH}$ ), $3.04(1 \mathrm{H}, \mathrm{dd}, J 19.3,4.7)$ and $2.68(1 \mathrm{H}, \mathrm{dd}, J$ 19.2, 9.1, $\mathrm{OHCCH}_{2}$ ), 2.32-2.24 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{MeO}_{2} \mathrm{CCH}_{2}$ ); $m / z$ (EI) $199\left(\mathrm{MH}^{+}, 3 \%\right), 185$ (10), 140 (16), 126 (19), 112 (20), 99 (100).
(3R,3aR,7aS)-4-(L-Menthoxy)-tetrahydroisobenzofuran-1,5(3H,6H)-dione (236)

A stirring solution of furanone $197(0.15 \mathrm{~g}, 0.63 \mathrm{mmol})$ and diene $198(0.18 \mathrm{~g}, 1.3$ $\mathrm{mmol})$ in dry toluene ( 1 mL ) was treated with microwave radiation while heated at 180 ${ }^{\circ} \mathrm{C}$ for 2 h . Concentration gave the crude adduct $199(0.32 \mathrm{~g})$ as a pale yellow viscous oil. Purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 3: 17\right)$ provided a $17: 3$ mixture of ketone 236 and its C3-epimer ( $0.10 \mathrm{~g}, 53 \%$ ), as a white solid; m.p. $90-92^{\circ} \mathrm{C}$
$\left[\right.$ lit. ${ }^{67}$ 93.2-93.4 $\left.{ }^{\circ} \mathrm{C}\right] ;[\alpha]_{D}^{20}-127.8\left(\mathrm{CHCl}_{3}\right.$, c 1.0$) ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2955,2926(\mathrm{CH})$, $1773,1724(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.27(0.85 \mathrm{H}, \mathrm{s})$ and $5.15(0.15 \mathrm{H}, \mathrm{s}, \mathrm{OCHO})$, $3.49(0.85 \mathrm{H}, \mathrm{td}, 10.7,4.0)$ and $3.27\left(0.15 \mathrm{H}, \mathrm{td}, J 10.4,4.0, \mathrm{OCHCH}_{2}\right), 3.19-3.06(1 \mathrm{H}$, $\mathrm{m}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), 2.89-2.73(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}), 2.54(1 \mathrm{H}, \mathrm{dd}, J 15.5,7.0$, $\mathrm{OCH}(\mathrm{OMen}) \mathrm{CHCHH}), 2.42-1.89\left(7 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}, \mathrm{OCH}(\mathrm{OMen}) \mathrm{CHCHH}\right.$, OCHCHH and CHMe 2 ), 1.70-1.55 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{Me}) \mathrm{CHHCH}_{2}$ and ${ }^{\mathrm{i}} \mathrm{PrCHCHH}$ ), 1.45$1.26\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CHMe}\right), 1.26-1.10\left(1 \mathrm{H}, \mathrm{m}, \mathrm{C} H^{\prime} \mathrm{Pr}\right), 1.04-0.77(3 \mathrm{H}, \mathrm{m}, \mathrm{OCHCHH}$, $\mathrm{CH}(\mathrm{Me}) \mathrm{CHHCH}_{2}$ and $\left.{ }^{\mathrm{i}} \mathrm{PrCHCH} H\right), 0.90\left(3 \mathrm{H}, \mathrm{d}, J 6.4, \mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.83(3 \mathrm{H}, \mathrm{d}, J$ $7.0)$ and $0.73\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 208.4\left(\mathrm{O}=\mathrm{CCH}_{2}\right), 177.1$ $(\mathrm{O}=\mathrm{CCH}), 108.0,102.7(\mathrm{OCHO}), 82.3,76.9\left(\mathrm{OCHCH}_{2}\right), 48.2,47.7\left(\mathrm{CH}^{\mathrm{i}} \mathrm{Pr}\right), 42.6$ $(\mathrm{OCH}(\mathrm{OMen}) \mathrm{CH}), \quad 39.6 \quad\left(\mathrm{OCHCH}_{2}\right), \quad 39.5 \quad\left(\mathrm{CH}(\mathrm{OMen}) \mathrm{CHCH}_{2}\right), \quad 37.4$ $\left(\mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}\right), 37.0(\mathrm{O}=\mathrm{CCH}), 34.2,34.1\left(\mathrm{CH}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 31.6,31.3\left(\mathrm{CHMe}_{2}\right)$, 25.8, $25.5\left(\mathrm{CH}_{2} \mathrm{CHMe}\right)$, 23.2, $23.0\left({ }^{\mathrm{i}} \mathrm{PrCHCH}_{2}\right), 22.4\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 22.2,20.9$ $\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 16.2,15.5\left(\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right) ; m / z(\mathrm{CI}+) 309\left(\mathrm{MH}^{+}, 9 \%\right), 171$ (43), 153 (100), 138 (95), 125 (41), 96 (73); HRMS (CI+) calcd for $\mathrm{C}_{18} \mathrm{H}_{29} \mathrm{O}_{4}\left(\mathrm{MH}^{+}\right)$309.2066, found 309.2057.

## 1-(4-Toluenesulfonyl)pyrrolidin-2-one (241)

2-Pyrrolidinone ( $9.0 \mathrm{~mL}, 118 \mathrm{mmol}$ ) in THF ( 60 mL ) was added slowly to a solution of ${ }^{\mathrm{n}} \mathrm{BuLi}(1.6 \mathrm{M}$ in hexanes, $79.3 \mathrm{~mL}, 127 \mathrm{mmol})$ in THF $(30 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. The resulting suspension was stirred at $-78^{\circ} \mathrm{C}$ for 90 min then a solution of $\mathrm{TsCl}(27.3 \mathrm{~g}, 143 \mathrm{mmol})$ in THF ( 60 mL ) was added via cannula, and the temperature was maintained at $-78^{\circ} \mathrm{C}$ for a further 30 min before warming to room temperature. After 16 h , the reaction was quenched by addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}(300 \mathrm{~mL})$ and the product was extracted with EtOAc ( $3 \times 300 \mathrm{~mL}$ ), washed with brine $(2 \times 500 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and recrystallisation from EtOAc afforded sulfonamide 241 ( 23.3 g , $83 \%$ ) as peach coloured needles; m.p. 145-147 ${ }^{\circ} \mathrm{C}\left[\right.$ lit. $\left.{ }^{164} 149{ }^{\circ} \mathrm{C}\right] ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2914$ $(\mathrm{CH}), 1730(\mathrm{C}=\mathrm{O}), 1593(\mathrm{C}=\mathrm{C}), 1356,1169\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.90(2 \mathrm{H}, \mathrm{d}, J$ $8.3,2 \times \mathrm{S}-\mathrm{oCH}), 7.32-7.29(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{S}-m \mathrm{CH}), 3.86\left(2 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{NCH}_{2}\right), 2.42-2.38$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}_{2}\right), 2.41\left(\mathrm{CH}_{3}\right), 2.08-2.01\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$
$173.4(\mathrm{C}=\mathrm{O}), 145.2,135.2(2 \times$ aromatic C), 129.7, $128.1(4 \times$ aromatic CH$), 47.3$ $\left(\mathrm{NCH}_{2}\right), 32.2\left(\mathrm{O}=\mathrm{CCH}_{2}\right), 21.7\left(\mathrm{CH}_{3}\right), 18.2\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 240\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{NO}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$240.0689, found 240.0678; Elemental analysis: calcd for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{NO}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right) \mathrm{C}: 55.2, \mathrm{H}: 5.5, \mathrm{~N}: 5.9$. Found C: 55.1, H: 5.4, N: 5.7.

## 3-(Phenylselenyl)-1-(4-toluenesulfonyl)pyrrolidin-2-one (242)

A solution of 1-(4-toluenesulfonyl)pyrrolidin-2-one ( $5.00 \mathrm{~g}, 21 \mathrm{mmol}$ ) in THF ( 50 mL ) was treated with LiHMDS ( $20 \%$ in hexanes, $40 \mathrm{~mL}, 42 \mathrm{mmol}$ ) and the mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h . A solution of $\mathrm{PhSeBr}(6.51 \mathrm{~g}, 28 \mathrm{mmol})$ in THF ( 50 mL ) was added via cannula, and the reaction mixture was maintained at $-78^{\circ} \mathrm{C}$ for a further 30 min , and then warmed to room temperature. After 2.5 h the reaction was quenched by addition of $1 \mathrm{M} \mathrm{HCl}(100 \mathrm{~mL})$ and the product was extracted with $\mathrm{EtOAc}(3 \times 100 \mathrm{~mL})$, washed with saturated $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$, brine $(100 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 3:7 $\rightarrow 2: 3$ ) afforded the title compound $\mathbf{2 4 2}{ }^{29}(8.11 \mathrm{~g}, 98 \%)$ as a viscous pale brown oil; $\delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.90(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-\mathrm{oCH}), 7.46-7.37(2 \mathrm{H}, \mathrm{m}), 7.37-7.25(3 \mathrm{H}, \mathrm{m})$ and 7.24-7.12 ( $2 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}$ ), 3.88-3.74 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CHSePh}$ and NCHH ), 3.63-3.48 ( $1 \mathrm{H}, \mathrm{m}$, $\mathrm{NCH} H), 2.57-2.40(1 \mathrm{H}, \mathrm{m})$ and 2.11-1.96 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 2.45\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(75$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.6(\mathrm{C}=\mathrm{O}), 145.3$ (aromatic C$), 136.1(2 \times$ aromatic CH$), 134.7$ (aromatic C), 129.7, 129.3, 129.1, $128.3(7 \times$ aromatic CH), 126.0 (aromatic C), 45.7 $\left(\mathrm{NCH}_{2}\right), 40.7(C H S e P h), 26.3\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 21.7\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}+) 396\left(\mathrm{MH}^{+}, 100 \%\right)$, 240 (31); HRMS (CI+) calcd for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{NO}_{3} \mathrm{SSe}\left(\mathrm{MH}^{+}\right)$396.0173, found 396.0173.

## 3-Bromo-1-(4-toluenesulfonyl)pyrrolidin-2-one (243)

To a stirring solution of 1-(4-toluenesulfonyl)pyrrolidin-2-one ( $5.00 \mathrm{~g}, 21 \mathrm{mmol}$ ) in THF ( 100 mL ) at $-78{ }^{\circ} \mathrm{C}$ was added LiHMDS ( $20 \%$ in hexanes, $39.4 \mathrm{~mL}, 42 \mathrm{mmol}$ ). After 1 h , a pre-cooled $\left(-78{ }^{\circ} \mathrm{C}\right)$ solution of NBS $(4.46 \mathrm{~g}, 25 \mathrm{mmol})$ in THF $(10 \mathrm{~mL})$ was added via cannula, and the suspension was stirred for 3 h at the same temperature. Saturated $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{~mL})$ was added and the reaction was warmed to room temperature. After dilution with brine ( 100 mL ), the product was extracted with EtOAc $(3 \times 100 \mathrm{~mL})$, washed with brine $(2 \times 200 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 3: 7\right)$ furnished the monobrominated product 243 ( $5.45 \mathrm{~g}, 82 \%$ ) as a white powder; m.p. $119.5-120{ }^{\circ} \mathrm{C}$; $v_{\text {max }} / \mathrm{cm}^{-1}(\mathrm{KBr}) 2907(\mathrm{CH}), 1738(\mathrm{C}=\mathrm{O}), 1593(\mathrm{C}=\mathrm{C}), 1358,1173\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.91(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.34(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}), 4.33(1 \mathrm{H}, \mathrm{dd}, J$ 6.7, 2.7, CHBr), 4.04-3.83 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2}$ ), $2.60(1 \mathrm{H}, \mathrm{td}, J 8.0,6.7)$ and $2.28(1 \mathrm{H}, \mathrm{ddt}, J$ 14.4, 6.2, 2.7, $\mathrm{NCH}_{2} \mathrm{CH}_{2}$ ), $2.44\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 168.5(\mathrm{C}=\mathrm{O}), 145.7$, $133.9(2 \times$ aromatic C$), 129.8,128.2(4 \times$ aromatic CH$), 45.4\left(\mathrm{NCH}_{2}\right), 43.4(\mathrm{CHBr})$, $29.8\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 21.8\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}+) 320,318\left(\mathrm{MH}^{+}, 33 / 31 \%\right), 240(100), 155(41)$, 125 (27), 107 (17); HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{BrNO}_{3} \mathrm{~S} 317.9800$, found 317.9788; Elemental analysis: calcd for $\mathrm{C}_{11} \mathrm{H}_{12}{ }^{79} \mathrm{BrNO}_{3} \mathrm{~S}$ C: $41.5, \mathrm{H}: 3.8, \mathrm{~N}: 4.4$. Found $\mathrm{C}: 41.6$, $\mathrm{H}: 3.8, \mathrm{~N}: 4.2$.

## 3,3-Dibromo-1-(4-toluenesulfonyl)-pyrrolidin-2-one

Dibrominated product isolated in $7 \%$ yield when 1.1 eq of LiHMDS was used; m.p. $188-189{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 1734(\mathrm{C}=\mathrm{O}), 1593(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}$ ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $7.91(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{S}-\mathrm{oCH}$ ), $7.36(2 \mathrm{H}, \mathrm{d}, J 8.0,2$
 $\times \mathrm{S}-m \mathrm{CH}), 3.85\left(2 \mathrm{H}, \mathrm{t}, J 6.0, \mathrm{NCH}_{2}\right), 3.00\left(2 \mathrm{H}, \mathrm{t}, J 6.0, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 2.45\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 164.7(\mathrm{C}=\mathrm{O}), 146.2,133.0(2 \times \operatorname{aromatic} \mathrm{C}), 129.9,128.3(4 \times$ aromatic CH$), 53.6\left(\mathrm{CBr}_{2}\right), 44.7\left(\mathrm{NCH}_{2}\right), 42.8\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 21.8\left(\mathrm{CH}_{3}\right) \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 400$, 398, $396\left(\mathrm{MH}^{+}, 19 / 39 / 19 \%\right), 320,318$ (84/85), 240 (100), 155 (86). 123 (31); HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{12}{ }^{79} \mathrm{Br}_{2} \mathrm{NO}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right) 395.8905$, found 395.8895; Elemental analysis: calcd for $\mathrm{C}_{11} \mathrm{H}_{11} \mathrm{Br}_{2} \mathrm{NO}_{3} \mathrm{~S} \mathrm{C}: 33.3, \mathrm{H}: 2.8, \mathrm{~N}: 3.5$. Found $\mathrm{C}: 33.3, \mathrm{H}: 2.8, \mathrm{~N}: 3.3$.

## 1-(4-Toluenesulfonyl)-1H-pyrrol-2(5H)-one (239)

From oxidation of 3-(phenylselenyl)-1-(4-toluenesulfonyl)pyrrolidin-2-one:
$\mathrm{H}_{2} \mathrm{O}_{2}$ ( $30 \%$ aqueous, $5.8 \mathrm{~mL}, 51 \mathrm{mmol}$ ) was added to a solution of 3-(phenylselenyl)-1-(4-toluenesulfonyl)pyrrolidin-2-one ( $8.04 \mathrm{~g}, 20 \mathrm{mmol}$ ) in EtOAc ( 100 mL ) at $0^{\circ} \mathrm{C}$. After 90 min , the reaction was warmed to room temperature and diluted with EtOAc ( 100 mL ), washed with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}(2 \times 250 \mathrm{~mL})$ and brine ( 250 $\mathrm{mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 2:3) produced the desired product $239(4.10 \mathrm{~g}, 85 \%)$ as a white solid.

From dehydrobromination of 3-bromo-1-(4-toluenesulfonyl)pyrrolidin-2-one with LiBr , $\mathrm{Li}_{2} \mathrm{CO}_{3}$ :

A stirring mixture of 3-bromo-1-(4-toluenesulfonyl)pyrrolidin-2-one (1.06 g, 3.3 $\mathrm{mmol}), \mathrm{LiBr}(0.35 \mathrm{~g}, 4.0 \mathrm{mmol})$ and $\mathrm{Li}_{2} \mathrm{CO}_{3}(0.29 \mathrm{~g}, 4.0 \mathrm{mmol})$ in DMF $(25 \mathrm{~mL})$ was heated at reflux for 3 h . The mixture was cooled to room temperature and after addition of $\mathrm{H}_{2} \mathrm{O}(350 \mathrm{~mL})$, was extracted with $\mathrm{EtOAc}(3 \times 90 \mathrm{~mL})$, which was washed with brine $(2 \times 90 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; EtOAc:PS $1: 9 \rightarrow 3: 7$ ) furnished the dehydrobrominated product $239(0.24 \mathrm{~g}, 29 \%)$ as a white solid.

From dehydrobromination of 3-bromo-1-(4-toluenesulfonyl)pyrrolidin-2-one with $\mathrm{CaCO}_{3}$ :

A stirring mixture of 3-bromo-1-(4-toluenesulfonyl)-pyrrolidin-2-one ( $0.50 \mathrm{~g}, 1.6$ $\mathrm{mmol})$ and $\mathrm{CaCO}_{3}(1.10 \mathrm{~g}, 11.0 \mathrm{mmol})$ in DMF $(9 \mathrm{~mL})$ was heated at reflux for 20 h . The mixture was cooled to room temperature and after addition of $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$, was extracted with EtOAc ( $4 \times 10 \mathrm{~mL}$ ), which was washed with brine $(2 \times 20 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Subsequent concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; EtOAc:PS 2:3) furnished the dehydrobrominated product 239 ( $0.13 \mathrm{~g}, 33 \%$ ) as a white solid.
m.p. $159-160{ }^{\circ} \mathrm{C}\left[\mathrm{lit}{ }^{29} 159-160{ }^{\circ} \mathrm{C}\right] ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 1717(\mathrm{C}=\mathrm{O}), 1597(\mathrm{C}=\mathrm{C}), 1354$, $1175\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.93(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.32(2 \mathrm{H}, \mathrm{d}, J 8.3,2$ $\times \mathrm{S}-m \mathrm{CH}), 7.24\left(1 \mathrm{H}, \mathrm{dt}, J 6.2,1.9, \mathrm{NCH}_{2} \mathrm{CH}\right), 6.05(1 \mathrm{H}, \mathrm{dt}, J 6.2,1.9, \mathrm{O}=\mathrm{CCH}), 4.48$ $\left(2 \mathrm{H}, \mathrm{t}, J 1.9, \mathrm{NCH}_{2}\right), 2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 168.4(\mathrm{C}=\mathrm{O}), 146.7$ $\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 145.2,135.3(2 \times$ aromatic C), 129.8, $128.0(4 \times$ aromatic CH$), 127.1$ $(\mathrm{O}=\mathrm{CCH}), 52.4\left(\mathrm{NCH}_{2}\right), 21.7\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 238\left(\mathrm{MH}^{+}, 100 \%\right), 173(31), 155(26)$, 107 (91), 91 (26), 87 (69); HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{NO}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$requires 238.0538 , found 238.0540 .

Typical procedure for microwave preparations of 5-methoxy-2-(4-toluenesulfonyl)isoindol-1-ones:

## 5-Methoxy-2-(4-toluenesulfonyl)-3a,4,7,7a-tetrahydro-(3H)-isoindol-1-one (244)

A solution of 1-(4-toluenesulfonyl)- 1 H -pyrrol-2( 5 H )-one ( $0.20 \mathrm{~g}, 0.84 \mathrm{mmol}$ ) and 2-methoxy-1,3,butadiene ( $0.21 \mathrm{~g}, 2.5 \mathrm{mmol}$ ) in toluene ( 1 mL ) was treated with microwave radiation at $125{ }^{\circ} \mathrm{C}$ for 4 h . Concentration and purification by silica chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 1: 4\right)$ afforded the lactam starting material $(0.07 \mathrm{~g}, 35 \%)$ and the desired adduct $244(0.04 \mathrm{~g}, 14 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2915, $2848(\mathrm{CH}), 1740(\mathrm{C}=\mathrm{O}), 1677(\mathrm{C}=\mathrm{C}), 1362,1152\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.88(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-\mathrm{oCH}), 7.31(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}), 4.49(1 \mathrm{H}, \mathrm{br} \mathrm{t}, J$ $3.5, \mathrm{C}=\mathrm{CH}), 3.89(1 \mathrm{H}, \mathrm{dd}, J 10.2,5.1)$ and $3.59\left(1 \mathrm{H}, \mathrm{d}, J 10.2, \mathrm{NCH}_{2}\right), 3.41(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 2.71-2.56\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}\right.$ and $\left.\mathrm{O}=\mathrm{CCH}\right), 2.51-2.34(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCHH})$, $2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.32-2.09(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCHH}$ and $(\mathrm{MeO}) \mathrm{CCHH}), 1.85-1.64$ $(1 \mathrm{H}, \mathrm{m},(\mathrm{MeO}) \mathrm{CCH} H) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 174.5(\mathrm{C}=\mathrm{O}), 152.9(\mathrm{HC}=C(\mathrm{OMe})), 145.1$, $135.2\left(2 \times\right.$ aromatic C), 129.7, $127.9(4 \times$ aromatic CH$), 90.6(\mathrm{C}=\mathrm{CH}), 54.0\left(\mathrm{OCH}_{3}\right)$, $51.9\left(\mathrm{NCH}_{2}\right), 41.2(\mathrm{O}=\mathrm{CCH}), 30.1\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 28.1\left((\mathrm{OMe}) \mathrm{CCH}_{2}\right), 21.7\left(\mathrm{ArCH}_{3}\right), 20.7$ $\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right) ; \mathrm{m} / \mathrm{z}$ (CI+) $322\left(\mathrm{MH}^{+}, 100 \%\right), 166$ (30); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{4} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$322.1113, found 322.1107.

## 5-Methoxy-2-(4-toluenesulfonyl)-3a,6,7,7a-tetrahydro-(3H)-isoindol-1-one (245)

1-(4-Toluenesulfonyl)-1 H -pyrrol-2( 5 H )-one ( $1.0 \mathrm{~g}, 4.2 \mathrm{mmol}$ ) and 2-methoxy-1,3butadiene $(0.71 \mathrm{~g}, 8.4 \mathrm{mmol})$ at $180^{\circ} \mathrm{C}$ for 2 h provided isomerised adduct $245(0.47 \mathrm{~g}$, $35 \%$ ) as a white solid; m.p. $120-125{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2930,2907(\mathrm{CH}), 1740$ (C=O), 1665, $1597(\mathrm{C}=\mathrm{C}) 1362,1165\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.85(2 \mathrm{H}, \mathrm{d}, J 8.3,2$ $\times$ S-oCH), 7.29 ( $2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}$ ), 4.36 ( $1 \mathrm{H}, \mathrm{br} \mathrm{d}, J 2.7, \mathrm{C}=\mathrm{CH}$ ), 3.94 ( $1 \mathrm{H}, \mathrm{dd}, J$ $9.9,6.4)$ and $3.60\left(1 \mathrm{H}, \mathrm{dd}, J 9.9,2.4, \mathrm{NCH}_{2}\right), 3.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.07-2.96(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{NCH}_{2} \mathrm{CH}\right), 2.66(1 \mathrm{H}, \mathrm{dt}, J 4.8,2.4, \mathrm{O}=\mathrm{CCH}), 2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.05-1.93(1 \mathrm{H}, \mathrm{m})$ and 1.73-1.58 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH}_{2}\right), 1.93-1.84\left(2 \mathrm{H}, \mathrm{m},(\mathrm{MeO}) \mathrm{CCH}_{2}\right) ; \delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 174.2(\mathrm{C}=\mathrm{O})$, $158.2(C(\mathrm{OMe})$ ), 145.0, $135.3(2 \times$ aromatic C$), 129.5,127.8(4 \times$ aromatic CH$), 92.4(\mathrm{C}=\mathrm{CH}), 54.0\left(\mathrm{OCH}_{3}\right), 53.1\left(\mathrm{NCH}_{2}\right), 41.8(\mathrm{O}=\mathrm{CCH}), 31.8$ $\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 23.8\left((\mathrm{MeO}) \mathrm{CCH}_{2}\right), 21.7\left(\mathrm{ArCH}_{3}\right), 20.2\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 322$ ( $\mathrm{MH}^{+}, 69 \%$ ), 307 (20), 289 (11), 219 (15), 199 (35), 166 (28), 154 (100); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{4} \mathrm{~S}\left(\mathrm{MH}^{+}\right) 322.1113$, found 322.1106.

## Typical procedure for ozonolysis of 5-methoxy-2-(4-toluenesulfonyl)isoindol-1-ones:

Methyl cis-[5-oxo-4-(2-oxoethyl)-1-(4-toluenesulfonyl)pyrrolidin-3-yl]-acetate (246)

Through a solution of methoxy-alkene $244(0.04 \mathrm{~g}, 0.12 \mathrm{mmol})$ in $\mathrm{DCM}(3 \mathrm{~mL})$ was bubbled ozone in $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$. When the solution became blue, oxygen was passed through the mixture until it was colourless. DMS ( $0.02 \mathrm{~mL}, 0.3 \mathrm{mmol}$ ) was added and the solution stirred for 16 h under argon, gradually warming up to room temperature. The volatiles were removed in vacuo, and the remaining oil was diluted with EtOAc (5 $\mathrm{mL})$. The solution was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 5 \mathrm{~mL})$, brine $(2 \times 5 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; $\mathrm{EtOAc}: \mathrm{PS}$ $1: 4 \rightarrow 2: 3$ ) afforded ozonolysed product $246(0.016 \mathrm{~g}, 38 \%)$ as a colourless oil; $\delta_{\mathrm{H}}(300$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 9.72 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}$ ), 7.88 ( $2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}$ ), 7.33 ( $2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times$ S-mCH), $3.93(1 \mathrm{H}, \mathrm{dd}, J 10.4,6.2)$ and $3.80\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,2.1, \mathrm{NCH}_{2}\right), 3.67(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.16(1 \mathrm{H}, \mathrm{td}, J 8.5,4.8, \mathrm{O}=\mathrm{CCH}), 3.06-2.94\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}\right), 2.88(1 \mathrm{H}, \mathrm{dd}, J$ $19.0,4.8)$ and $2.55\left(1 \mathrm{H}, \mathrm{dd}, J 19.0,8.5, \mathrm{OHCCH}_{2}\right), 2.43\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.23(1 \mathrm{H}, \mathrm{dd}, J$
$16.3,5.6)$ and $2.12\left(1 \mathrm{H}, \mathrm{dd}, J 16.3,9.1, \mathrm{MeO}_{2} \mathrm{CCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 198.6$ ( CHO ), $172.9(\mathrm{NC}=\mathrm{O}), 171.4\left(\mathrm{CO}_{2} \mathrm{Me}\right), 145.5,134.7(2 \times$ aromatic C), 129.8, 128.1 ( 4 $\times$ aromatic CH$), 52.1\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right), 50.8\left(\mathrm{NCH}_{2}\right), 41.1(\mathrm{O}=\mathrm{CCH}), 39.7\left(\mathrm{OHCCH}_{2}\right), 33.1$ $\left(\mathrm{MeO}_{2} \mathrm{CCH}_{2}\right), 31.3\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 21.7\left(\mathrm{ArCH}_{3}\right) ; \mathrm{m} / z(\mathrm{ESI}+) 376\left(\mathrm{MNa}^{+}, 100 \%\right) ;$ HRMS (ESI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{SNa}\left(\mathrm{MH}^{+}\right) 376.0831$, found 376.0837

## Methyl 3-(4-formyl-2-oxo-1-(4-toluenesulfonyl)-pyrrolidin-3-yl)propanoate (247)

Methoxy-diene 245 ( $0.47 \mathrm{~g}, 1.4 \mathrm{mmol}$ ) provided cleaved product $247(0.31 \mathrm{~g}, 60 \%)$ as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr})$ $2955(\mathrm{CH}), 1730(\mathrm{C}=\mathrm{O}), 1597,1358,1168\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.72(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.90(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-$
 $o \mathrm{CH}), 7.34(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}), 4.22(1 \mathrm{H}, \mathrm{dd}, J 10.8,2.7)$ and $3.86(1 \mathrm{H}, \mathrm{dd}, J$ $\left.10.8,6.4, \mathrm{NCH}_{2}\right), 3.64\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.35-3.26\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}\right), 2.96(1 \mathrm{H}, \mathrm{dd}, J$ $15.5,8.0, \mathrm{NC}(=\mathrm{O}) \mathrm{CH}), 2.52-2.45\left(2 \mathrm{H}, \mathrm{m}, \mathrm{MeO}_{2} \mathrm{CCH}_{2}\right), 2.43\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.99-1.75$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{MeO}_{2} \mathrm{CCH}_{2} \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 198.4(\mathrm{CHO}), 172.9(\mathrm{NC}=\mathrm{O}), 172.0$ $\left(\mathrm{CO}_{2} \mathrm{Me}\right), 145.6,134.8(2 \times$ aromatic C$), 129.8,128.1(4 \times$ aromatic CH$), 51.8\left(\mathrm{OCH}_{3}\right)$, $46.3\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 44.6\left(\mathrm{NCH}_{2}\right), 43.9(\mathrm{NC}(=\mathrm{O}) \mathrm{CH}), 31.0\left(\mathrm{MeO}_{2} \mathrm{CCH}_{2}\right), 21.7\left(\mathrm{ArCH}_{3}\right)$, $21.3\left(\mathrm{MeO}_{2} \mathrm{CCH}_{2}\right) ; m / z(\mathrm{CI}+) 354\left(\mathrm{MH}^{+}, 12 \%\right), 322$ (13), 200 (12), 168 (100), 141 (16), 125 (79), 93 (43); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{6} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$354.1011, found 354.1017.

Tetrahydro-2-(4-toluenesulfonyl)-6-isoindole-1,5(3H,6H)-dione (249)

A solution of 1-(4-toluenesulfonyl)-1 H -pyrrol-2(5H)-one ( $0.50 \mathrm{~g}, 2.1 \mathrm{mmol}$ ) and 2-trimethylsilyloxy-1,3-butadiene $(0.60 \mathrm{~g}, 4.2 \mathrm{mmol})$ in toluene $(2 \mathrm{~mL})$ was treated with microwave radiation at $180{ }^{\circ} \mathrm{C}$ for 2 h . Concentration provided the crude trimethylsilyloxy-2-(4-toluenesulfonyl)-isoindol-1-one ( 1.07 g ) as a dark brown oil. Purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 3: 7\right)$ provided the desilylated analogue $249(0.13 \mathrm{~g}, 21 \%)$ as a yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 2957 $(\mathrm{CH}), 1722(\mathrm{C}=\mathrm{O}), 1360,1169\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.91(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-$
$o \mathrm{CH}), 7.35(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}), 3.96(1 \mathrm{H}, \mathrm{dd}, J 10.4,6.2)$ and $3.58(1 \mathrm{H}, \mathrm{dd}, J$ $10.4,2.3, \mathrm{NCH}_{2}$ ), 2.94-2.84 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}$ ), 2.84-2.74 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCH}$ ), 2.55-2.48 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CHCHH}\right), 2.44\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.31-2.07\left(4 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH}_{2} \mathrm{CH}_{2}\right.$, $\mathrm{NCH}_{2} \mathrm{CHCH} H$ and $\left.\mathrm{O}=\mathrm{CCHCHH}\right), 2.07-1.92(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCH} H) ; \delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 208.8\left(\mathrm{CH}_{2} \mathrm{C}=\mathrm{O}\right), 173.3(\mathrm{NC}=\mathrm{O}), 145.6,134.8(2 \times$ aromatic C$)$, 129.9, 127.9 ( 4 $\times$ aromatic CH$), 51.2\left(\mathrm{NCH}_{2}\right), 41.8(\mathrm{O}=\mathrm{CCH}), 41.5\left(\mathrm{NCH}_{2} \mathrm{CHCH}_{2}\right), 37.2(\mathrm{O}=\mathrm{CCH}$ $\left.\mathrm{CH}_{2} \mathrm{CH}_{2}\right), 32.6\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 22.6\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 21.7\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}+) 308\left(\mathrm{MH}^{+}\right.$, 84\%), 238 (46), 193 (19), 168 (100), 154 (54), 136 (17); HRMS (CI+) calcd for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{NO}_{4} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$308.0957, found 308.0962.

## (S)-1,1-Bis(3,5-dimethylphenyl)prolinol sulfate salt (252) ${ }^{93,94}$

An 100 mL 3-necked flask equipped with a reflux condenser, low temperature thermometer probe and a septum was charged with $(S)$-proline ( $1.50 \mathrm{~g}, 13.0 \mathrm{mmol}$ ) and THF ( 15 mL ). The mixture was cooled to $15-20^{\circ} \mathrm{C}$ and a solution of triphosgene ( 1.54 $\mathrm{g}, 5.2 \mathrm{mmol}$ ) in THF ( 3 mL ) was added slowly, maintaining the internal temperature below $20{ }^{\circ} \mathrm{C}$. The septum was then quickly replaced with a glass stopper and the suspension heated to $44^{\circ} \mathrm{C}$, where the reaction became homogenous after 15 min . After heating for an additional 30 min , the reaction mixture was concentrated, re-dissolved in THF ( 15 mL ) then cooled to $0^{\circ} \mathrm{C} . \mathrm{Et}_{3} \mathrm{~N}(1.8 \mathrm{~mL}, 13.0 \mathrm{mmol})$ was added over 7 min via syringe pump, maintaining the internal temperature below $5{ }^{\circ} \mathrm{C}$. After 30 min , the reaction was warmed to room temperature then filtered under a flow of argon. The cake was washed with THF ( $5 \times 5 \mathrm{~mL}$ ) to provide a solution of the carboxyanhydride that was used immediately in the next reaction.

A 250 mL 3-necked flask fitted with a reflux condenser, pressure-equalising addition funnel and a stopper was charged with Mg turnings ( $1.30 \mathrm{~g}, 54 \mathrm{mmol}$ ) and 10 mL of a solution of 5-bromo-m-xylene ( $5.5 \mathrm{~mL}, 41 \mathrm{mmol}$ ) in THF ( 20 mL ). The suspension was vigorously stirred and when it became exothermic and brown in colour, the remaining bromide was added dropwise, and then stirred for 1 h at room temperature. The glass
stopper was quickly replaced with a low temperature thermometer probe and $\sim 1 \mathrm{~mL}$ of the carboxyanhydride solution was added, then the mixture was cooled to $-15{ }^{\circ} \mathrm{C}$. The remaining solution of carboxyanhydride was added dropwise at a rate that maintained the internal temperature below $-10{ }^{\circ} \mathrm{C}$. When the addition was complete, the mixture was stirred for 3 h at $-15^{\circ} \mathrm{C}, 2 \mathrm{~h}$ at $0^{\circ} \mathrm{C}$ then at room temperature for 16 h . The reaction was quenched by its dropwise addition into a flask of $2 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}(26.3 \mathrm{~mL}, 53 \mathrm{mmol})$ cooled at $0{ }^{\circ} \mathrm{C}$, maintaining the internal temperature below $20{ }^{\circ} \mathrm{C}$. The resulting suspension was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h then filtered, washing the cake with THF ( $3 \times 15$ $\mathrm{mL})$. The filtrate was concentrated, cooled at $0{ }^{\circ} \mathrm{C}$ for 1 h , and then filtered. The cake was washed with cold $\mathrm{H}_{2} \mathrm{O}(2 \times 3 \mathrm{~mL})$ and EtOAc $(3 \times 4 \mathrm{~mL})$ then dried to afford the prolinol sulfate salt $252(2.58 \mathrm{~g}, 55 \%)$ as a white solid; m.p. $=251-252{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}$ ( KBr ) 3277 (br, OH), $1602(\mathrm{C}=\mathrm{C}), 1539$; $\delta_{\mathrm{H}}(300 \mathrm{MHz}, \mathrm{MeOH}) 7.20(2 \mathrm{H}, \mathrm{s}), 7.10(2 \mathrm{H}$, s), $6.89(2 \mathrm{H}, \mathrm{s}, 6 \times \mathrm{ArCH}), 4.87\left(3 \mathrm{H}, \mathrm{m}, \mathrm{OH}\right.$ and $\left.\mathrm{NH}_{2}{ }^{+}\right), 4.81-4.73(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}), 3.28-$ $3.13\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2}\right), 2.28\left(12 \mathrm{H}, \mathrm{s}, 4 \times \mathrm{CH}_{3}\right), 2.20-1.91\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 145.8, 145.6, 139.5, 139.2 ( $6 \times$ aromatic C), 130.1, 129.9, 124.6, 124.4 (6 $\times$ aromatic CH$), 78.2(\mathrm{C}(\mathrm{OH})), 68.2\left(\mathrm{NCH}_{2}\right), 48.7(\mathrm{NCH}), 27.1,25.5\left(\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, $21.6,21.5\left(4 \times \mathrm{CH}_{3}\right)$;

## (S)-1,1-Bis(3,5-dimethylphenyl)prolinol (253) ${ }^{93,94}$

A mixture of the prolinol sulfate salt $252(1.00 \mathrm{~g}, 2.80 \mathrm{mmol})$ and $2 \mathrm{M} \mathrm{NaOH}(2.8 \mathrm{~mL}$, 5.6 mmol ) in THF ( 6 mL ) was vigorously stirred for 30 min then toluene ( 11 mL ) was added and the mixture stirred for an additional 30 min . The aqueous phase was removed and the organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$, concentrated, re-dissolved in toluene $(10 \mathrm{~mL})$ then concentrated to afford a pale brown oil which crystallised at room temperature. Recrystallisation from hexane afforded the free prolinol 253 ( $0.58 \mathrm{~g}, 67 \%$ ) as a peach coloured solid; m.p. $99-100{ }^{\circ} \mathrm{C}\left[\right.$ lit. $\left.{ }^{93} 97.5-98{ }^{\circ} \mathrm{C}\right] ;[\alpha]_{D}^{20}-55.6(\mathrm{MeOH}, \mathrm{c}$ 0.322), [lit. $\left.{ }^{93}-63.0(\mathrm{MeOH}, \mathrm{c} 0.318)\right] ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 3368(\mathrm{br}, \mathrm{OH}), 2980(\mathrm{NH})$, 2912, 2862 (CH), 1601 (C=C), 1454, 1387; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.18(2 \mathrm{H}, \mathrm{s}), 7.12$
$(2 \mathrm{H}, \mathrm{s}), 6.81(2 \mathrm{H}, \mathrm{s}, 6 \times \mathrm{ArCH}), 4.60(1 \mathrm{H}, \mathrm{br} s, \mathrm{OH}), 4.22(1 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{NCH}), 3.09-2.99$ $(1 \mathrm{H}, \mathrm{m})$ and 2.99-2.88 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2}\right), 2.30(6 \mathrm{H}, \mathrm{s})$ and $2.29\left(6 \mathrm{H}, \mathrm{s}, 4 \times \mathrm{CH}_{3}\right), 1.9(1 \mathrm{H}$, br s, NH), 1.81-1.67 ( $2 \mathrm{H}, \mathrm{m}$ ) and 1.67-1.53 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ); $\delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ) 148.3, 145.4, 137.5, $137.2(6 \times$ aromatic C$)$, 128.1, 128.0 123.6, $123.3(6 \times$ aromatic CH$), 76.9(\mathrm{C}(\mathrm{OH})), 64.5\left(\mathrm{NCH}_{2}\right), 46.8(\mathrm{NCH}), 26.325 .6\left(\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, $21.6\left(4 \times \mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}+) 310\left(\mathrm{MH}^{+}, 8 \%\right), 292$ (52), 239 (100), 133 (45), 107 (54), 95 (24); HRMS (CI+) calcd for $\mathrm{C}_{21} \mathrm{H}_{28} \mathrm{NO}\left(\mathrm{MH}^{+}\right) 310.2171$, found 310.2168; Elemental analysis: calcd for $\mathrm{C}_{21} \mathrm{H}_{27} \mathrm{NO} \mathrm{C:} \mathrm{81.5} \mathrm{H}:, 8.8, \mathrm{~N}: 4.5$. Found C: 81.1, H: 8.6, N: 4.5.

## Tri-o-tolyboroxine (254) ${ }^{85}$

A 25 mL round bottomed flask fitted with a short path distillation kit was charged with $o$-tolylboronic acid ( $0.50 \mathrm{~g}, 3.7 \mathrm{mmol}$ ). Distillations of benzene ( 3 x 10 mL ) from the acid afforded the crude boroxine product ( $0.44 \mathrm{~g}, 100 \%$ ). Recrystallisation from a benzene-hexane mixture provided the pure boroxine $254(0.27 \mathrm{~g}, 62 \%)$ as a white solid; m.p. $171-172{ }^{\circ} \mathrm{C}\left[\mathrm{lit} .{ }^{85} 165-166{ }^{\circ} \mathrm{C}\right] ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 1599,1443,1342,1298 ; \delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.22(3 \mathrm{H}, \mathrm{dd}, J 7.5,1.7,3 \times \mathrm{B}-o \mathrm{CH}), 7.45(3 \mathrm{H}, \mathrm{td}, J 7.5,1.7,3 \times \mathrm{B}-\mathrm{pCH})$, $7.31(3 \mathrm{H}, \mathrm{td}, 7.4,1.3,3 \times \mathrm{Me}-p \mathrm{CH}), 7.27(3 \mathrm{H}, \mathrm{d}, J 7.6,3 \times \mathrm{Me}-o \mathrm{CH}), 2.82(9 \mathrm{H}, \mathrm{s}, 3 \times$ $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 146.3(3 \times \mathrm{CMe}), 137.2,132.2,130.6(9 \times$ aromatic CH$)$, $130.4(3 \times \mathrm{BC}), 125.2(3 \times \operatorname{aromatic} \mathrm{CH}), 23.1\left(3 \times \mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}+) 383\left(\mathrm{M}+\mathrm{C}_{2} \mathrm{H}_{5}\right.$, $17 \%), 355\left(\mathrm{MH}^{+}, 100\right), 119$ (15), 93 (94); HRMS (CI+) calcd for $\mathrm{C}_{21} \mathrm{H}_{22} \mathrm{~B}_{3} \mathrm{O}_{3}\left(\mathrm{MH}^{+}\right)$ 355.1848, found 355.1852; Elemental analysis: calcd for $\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{~B}_{3} \mathrm{O}_{3} \mathrm{C}: 71.3$, $\mathrm{H}: 6.0$. Found C: 71.4, H: 6.0.

5-Methyl-2-(4-toluenesulfonyl)-3a,4,7,7a-tetrahydro-(3H)-isoindol-1-one (256a) and 6-Methyl-2-(4-toluenesulfonyl)-3a,4,7,7a-tetrahydro-(3H)-isoindol-1-one (256b) ${ }^{73}$

A mixture of 1-(4-toluenesulfonyl)-1 H -pyrrol-2(5H)-one ( $0.10 \mathrm{~g}, 0.4 \mathrm{mmol}$ ), isoprene $(0.97 \mathrm{~mL}, 9.7 \mathrm{mmol})$ and $\mathrm{AlCl}_{3}(0.02 \mathrm{~g}, 0.1 \mathrm{mmol})$ in DCM ( 3 mL ) was heated at $50^{\circ} \mathrm{C}$ for 24 h . The reaction was cooled to $0^{\circ} \mathrm{C}$ and was quenched by addition of saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$. The product was then extracted with DCM ( 10 mL ), and washed with saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$, brine $(2 \times 5 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 9 \rightarrow 1: 4\right)$ provided a $3: 1$ regioisomeric mixture of the adducts $\mathbf{2 5 6 a} \mathbf{2 5 6 b}(0.10 \mathrm{~g}, 78 \%)$ as a colourless oil; $v_{\text {max }} / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) $2912(\mathrm{CH}), 1737(\mathrm{C}=\mathrm{O}), 1362,1167\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.89(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.32(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-m \mathrm{CH}), 5.35-5.26(1 \mathrm{H}$, $\left.\mathrm{m},\left(\mathrm{H}_{3} \mathrm{C}\right) \mathrm{C}=\mathrm{C} H\right), 3.86(1 \mathrm{H}, \mathrm{dd}, J 9.6,5.4)$ and $3.50\left(1 \mathrm{H}, \mathrm{dd}, J 9.6,2.1, \mathrm{NCH}_{2}\right), 2.70$ $(0.25 \mathrm{H}, \mathrm{td}, J 7.5,2.9)$ and $2.60\left(0.75 \mathrm{H}, \mathrm{td}, J 7.5,2.9, \mathrm{NCH}_{2} \mathrm{CH}\right), 2.56-2.47(1 \mathrm{H}, \mathrm{m}$, $\mathrm{O}=\mathrm{CCH}), 2.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.35(0.25 \mathrm{H}, \mathrm{br} \mathrm{s})$ and $2.28(0.75 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{O}=\mathrm{CCHCHH})$, 2.24-2.09 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{CCHCHH}\right.$ and $\left.\mathrm{NCH}_{2} \mathrm{CHCHH}\right), 2.03(1 \mathrm{H}, \mathrm{dd}, J 17.4,7.5$, $\left.\mathrm{NCH}_{2} \mathrm{CHCHH}\right), 1.57\left(3 \mathrm{H}, \mathrm{H}_{2} \mathrm{CC}\left(\mathrm{CH}_{3}\right)\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 174.8(\mathrm{C}=\mathrm{O}), 145.0$, $135.2(2 \times$ aromatic C$)$, $131.7\left(\mathrm{H}_{2} \mathrm{CC}=\mathrm{CMe}\right), 129.7,127.9(4 \times$ aromatic CH$), 118.7$ $\left(\mathrm{H}_{2} \mathrm{CC}=\mathrm{CH}\right), 52.2\left(\mathrm{NCH}_{2}\right), 41.8,40.7(\mathrm{O}=\mathrm{CCH}), 29.9\left(\mathrm{NCH}_{2} \mathrm{CH}\right), 29.5,28.3$ $\left(\mathrm{NCH}_{2} \mathrm{CHCH}_{2}\right), 23.7,21.8\left(\mathrm{O}=\mathrm{CCHCH}_{2}\right), 21.7\left(\mathrm{ArCH}_{3}\right) ; m / z(\mathrm{CI}+) 306\left(\mathrm{MH}^{+}, 100 \%\right)$, 150 (74), 107 (36), 93 (60); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right) 306.1164$, found 306.1160 .

Diethyl phosphonoacetone (262) ${ }^{98}$

To a solution of chloroacetone $(5.00 \mathrm{~g}, 54 \mathrm{mmol})$ in acetone ( 16.5 mL ) and acetonitrile $(14 \mathrm{~mL})$ were added KI $(8.97 \mathrm{~g}, 54 \mathrm{mmol})$ and triethyl phosphite $(8.98 \mathrm{~g}, 54 \mathrm{mmol})$. The resulting suspension was stirred for 6 h at room temperature, then at $50^{\circ} \mathrm{C}$ for 16 h .

Filtration, removal of solvents and subsequent distillation provided phosphonoacetone $\mathbf{2 6 2}{ }^{165}(6.64 \mathrm{~g}, 63 \%)$ as a colourless liquid; b.p. $101-102{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}$ [lit. ${ }^{98} 100-101$ $\left.{ }^{\circ} \mathrm{C} / 2 \mathrm{mmHg}\right] ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.17\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}\right), 3.06(2 \mathrm{H}, \mathrm{d}, J 22.9$, $\left.\mathrm{CH}_{2} \mathrm{P}\right), 2.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}(=\mathrm{O}) \mathrm{CH}_{3}\right), 1.85-1.29\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 199.9(\mathrm{~d}, J 5.9, \mathrm{C}=\mathrm{O}), 62.5\left(\mathrm{~d}, J 6.5,2 \times \mathrm{OCH}_{2}\right), 43.4\left(\mathrm{~d}, J 126.2, \mathrm{CH}_{2} \mathrm{P}\right), 31.3$ $\left(\mathrm{s}, \mathrm{C}(=\mathrm{O}) \mathrm{CH}_{3}\right), 16.3\left(\mathrm{~d}, J 6.2,2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$.

## Allyl (tert-butyldimethyl)silyl ether (264) ${ }^{166}$

To a solution of allyl alcohol ( $0.50 \mathrm{~g}, 8.6 \mathrm{mmol}$ ) in DCM ( 5 mL ) was added DMAP $(0.11 \mathrm{~g}, 0.86 \mathrm{mmol})$, followed by the dropwise addition of $\operatorname{TBSCl}(1.56,10.3 \mathrm{mmol})$ in DCM ( 2 mL ). After 16 h , the reaction mixture was washed with saturated $\mathrm{NaHCO}_{3}(3 \times$ $10 \mathrm{~mL})$, brine ( $3 \times 10 \mathrm{~mL}$ ), and then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right.$; PS) afforded protected alcohol $\mathbf{2 6 4}^{166}(0.08 \mathrm{~g}, 5 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.92\left(1 \mathrm{H}\right.$, ddt, $\left.J 17.1,10.4,4.6, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.26$ $(1 \mathrm{H}, \mathrm{dq}, J 17.1,1.9)$ and $5.08\left(1 \mathrm{H}, \mathrm{dq}, J 10.4,1.7, H_{2} \mathrm{C}=\mathrm{CH}\right), 4.17(2 \mathrm{H}, \mathrm{dt}, J 4.6,1.9$, $\left.\mathrm{CH}_{2} \mathrm{OTBS}\right), 0.92\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.07\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 137.5$ $\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right)$, $113.9\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right)$, $64.1\left(\mathrm{CH}_{2}\right)$, $25.9\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right)$, $18.4\left(\mathrm{CMe}_{3}\right),-5.3$ $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$.
(Z)-1,4-Bis-(tert-butyldimethylsilyloxy)-2-butene
(265) and
(Z)-4-(tert-Butyldimethylsilyloxy)-2-buten-1-ol (266) ${ }^{167}$

To a solution of cis-butene-1,4-diol ( $8.8 \mathrm{~g}, 100 \mathrm{mmol}$ ) in DMF ( 20 mL ) at $-10^{\circ} \mathrm{C}$ were added imidazole ( $1.4 \mathrm{~g}, 20.9 \mathrm{mmol}$ ) and $\mathrm{TBSCl}(3.0 \mathrm{~g}, 20 \mathrm{mmol})$. The reaction was stirred at $-10^{\circ} \mathrm{C}$ for 30 min then at room temperature for 3 d , and then poured into $\mathrm{H}_{2} \mathrm{O}$ $(150 \mathrm{~mL})$. The product was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 150 \mathrm{~mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(100$ $\mathrm{mL})$, brine $(100 \mathrm{~mL})$ and then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:9 $\rightarrow 1: 4$ ) afforded doubly protected diol $\mathbf{2 6 5}^{168}$ (0.47 $\mathrm{g}, 7 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.54(2 \mathrm{H}, \mathrm{br} \mathrm{t}, J 3.5, \mathrm{HC=CH}), 4.17$
( 4 H , br d, J 3.8, $2 \times \mathrm{CH}_{2}$ ), $0.90\left(18 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.06\left(12 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $130.2(\mathrm{C}=\mathrm{C})$, $59.6\left(2 \times \mathrm{CH}_{2}\right), 25.9\left(2 \times \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 18.3\left(2 \times \mathrm{CMe}_{3}\right)$, $-5.2\left(2 \times \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$.

Further elution provided monoprotected diol $\mathbf{2 6 6}^{169}(3.29 \mathrm{~g}, 82 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.69-5.56(2 \mathrm{H}, \mathrm{m}, \mathrm{HC}=\mathrm{CH}), 4.25\left(2 \mathrm{H}, \mathrm{d}, J 3.6, \mathrm{CH}_{2} \mathrm{OTBS}\right), 4.21$ $\left(2 \mathrm{H}, \mathrm{d}, J 4.5, \mathrm{CH}_{2} \mathrm{OH}\right), 2.83(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 0.87\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.05(6 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 131.1$ and $130.1(\mathrm{C}=\mathrm{C}), 59.5$ and $58.6\left(2 \times \mathrm{CH}_{2}\right), 25.9$ $\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 18.3\left(\mathrm{CMe}_{3}\right),-5.3\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$.

## 2,4,6-Tris-(tert-butyldimethylsilyloxymethyl)-1,3,5-trioxane (267)

Through a solution of protected diol $265(0.40 \mathrm{~g}, 1.3 \mathrm{mmol})$ in DCM ( 13 mL ) was bubbled ozone in $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$. When the solution became blue, oxygen was passed through the solution until it became colourless. Following the addition of DMS (0.19 $\mathrm{mL}, 2.5 \mathrm{mmol}$ ), the reaction mixture was slowly warmed to room temperature. After 16 h , the mixture was concentrated and the crude product was dissolved in DCM ( 20 mL ). The solution was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 20 \mathrm{~mL})$ and brine $(2 \times 20 \mathrm{~mL})$, and then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS}\right.$ 1:9) afforded the trimeric product $267(0.23 \mathrm{~g}, 53 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}$ ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.27(3 \mathrm{H}, \mathrm{t}, J 4.6,3 \times \mathrm{OCHO}), 3.62\left(6 \mathrm{H}, \mathrm{d}, J 4.6,3 \times \mathrm{OCH}_{2}\right), 0.89(27 \mathrm{H}$, s, $\left.3 \times \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.08\left(18 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 103.2(3 \times \mathrm{OCHO})$, $62.2\left(3 \times \mathrm{OCH}_{2}\right), 25.8\left(3 \times \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 18.3\left(3 \times \mathrm{CMe}_{3}\right),-5.3\left(3 \times \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; m / z(\mathrm{CI}+)$ $522\left(\mathrm{MH}^{+}, 0.01 \%\right), 174$ (22), 159 (68), 117 (66), 85 (100).
(E)-4-(tert-Butyldimethylsilyloxy)-2-butenal (268) ${ }^{170}$

Powdered 4A molecular sieves ( 0.52 g ) and PCC $(0.55 \mathrm{~g}, 2.6 \mathrm{mmol})$ were successively added to a solution of alcohol $266(0.50 \mathrm{~g}, 2.5 \mathrm{mmol})$ in DCM $(6 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The temperature was maintained at $0^{\circ} \mathrm{C}$ for 10 min then at room temperature for 15 h . After concentration, $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added and the resulting suspension filtered through Celite ${ }^{\circledR}$, washing with $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 1: 9\right)$ afforded the title aldehyde ${ }^{171}(0.11 \mathrm{~g}$, $21 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.60(1 \mathrm{H}, \mathrm{d}, J 8.1, \mathrm{CHO}), 6.88(1 \mathrm{H}$, dt, $\left.J 15.4,3.3, \mathrm{CHCH}_{2}\right), 6.39(1 \mathrm{H}, \mathrm{ddt}, J 15.4,8.1,2.1, \mathrm{OHCCH}), 4.45(2 \mathrm{H}, \mathrm{dd}, J 3.2$, 2.2, $\left.\mathrm{CH}_{2}\right), 0.92\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.09\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 193.4$ $(\mathrm{CHO}), 156.5\left(\mathrm{CHCH}_{2}\right), 130.6(\mathrm{OHCCH}), 62.3\left(\mathrm{CH}_{2}\right), 25.8\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 18.3\left(\mathrm{CMe}_{3}\right)$, $-5.5\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$.

## (E)-5-(tert-Butyldimethylsilyloxy)-pent-3-en-2-ol (269)

$\mathrm{MeLi}\left(1.6 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 0.4 \mathrm{~mL}, 0.7 \mathrm{mmol}\right)$ was added to a solution of aldehyde $268(0.10$ $\mathrm{g}, 0.50 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ at $-10^{\circ} \mathrm{C}$. Stirring was continued at $-10{ }^{\circ} \mathrm{C}$ for 30 min , then at room temperature for 3 h . Following the addition of $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$, the product was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 10 \mathrm{~mL})$, then washed with brine $(20 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; PS $\rightarrow$ EtOAc:PS 3:7) afforded alcohol $\mathbf{2 6 9}{ }^{97}(0.06 \mathrm{~g}, 51 \%)$ as a colourless liquid; $\delta_{\mathrm{H}}(400$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 5.78-5.72 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{HC=CH}$ ), 4.39-4.28 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CH}(\mathrm{OH})$ ), $4.17(2 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\left.\mathrm{CH}_{2}\right), 1.58(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J 17.7, \mathrm{OH}), 1.27\left(3 \mathrm{H}, \mathrm{d}, J 6.3, \mathrm{CHCH}_{3}\right), 0.91\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right)$, $0.07\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 133.9\left(\mathrm{C}=\mathrm{CCH}_{2}\right), 129.2(\mathrm{CHC=C}), 68.2$

## (E)-5-(tert-Butyldimethylsilyloxy)-pent-3-en-2-one (259) ${ }^{170}$

Powdered $4 \AA$ molecular sieves $(0.51 \mathrm{~g})$ and PCC $(0.54 \mathrm{~g}, 2.5 \mathrm{mmol})$ were successively added to a stirring solution of alcohol $269(0.53 \mathrm{~g}, 2.4 \mathrm{mmol})$ in DCM $(6 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The reaction temperature was maintained at $0{ }^{\circ} \mathrm{C}$ for 10 min then at room temperature
for 16 h . After concentration, $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added and the resulting suspension filtered through Celite ${ }^{\circledR}$, washing with $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{PS} \rightarrow \mathrm{EtOAc}: \mathrm{PS} 1: 9\right)$ afforded methyl ketone $\mathbf{2 5 9}{ }^{97}(0.26 \mathrm{~g}$, $51 \%$ ) as a colourless liquid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.83\left(1 \mathrm{H}, \mathrm{dt}, J 15.8,3.5, \mathrm{CHCH}_{2}\right)$, $6.34\left(1 \mathrm{H}, \mathrm{dt}, J 15.8,2.1, H \mathrm{C}=\mathrm{CHCH}_{2}\right), 4.36$ ( $2 \mathrm{H}, \mathrm{dd}, J 3.5,2.1, \mathrm{CH}_{2}$ ), $2.27(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{COCH}_{3}\right), 0.92\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.08\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 198.4$ $(\mathrm{C}=\mathrm{O}), 146.2\left(\mathrm{CHCH}_{2}\right), 128.8\left(\mathrm{HC}=\mathrm{CHCH}_{2}\right), 62.2\left(\mathrm{CH}_{2}\right), 27.3\left(\mathrm{COCH}_{3}\right), 25.8$ $\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 18.4\left(\mathrm{CMe}_{3}\right),-5.4\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$.

## ( $\boldsymbol{E}$ )-4-Bromobut-2-en-1-ol (274) ${ }^{104}$

To a stirring solution of methyl-4-bromocrotonate ( $20.0 \mathrm{~mL}, 170 \mathrm{mmol}$ ) in toluene ( 90 mL ) at $-78{ }^{\circ} \mathrm{C}$ was slowly added DIBAH ( $20 \%$ in toluene, $305 \mathrm{~mL}, 366 \mathrm{mmol}$ ). After maintaining the temperature at $-78{ }^{\circ} \mathrm{C}$ for 30 min , the reaction was quenched with $50 \%$ aqueous $\mathrm{AcOH}(43 \mathrm{~mL}, 375 \mathrm{mmol})$ then warmed to room temperature. Filtration over Celite ${ }^{\circledR}$, washing with acetone ( $5 \times 90 \mathrm{~mL}$ ) followed by concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{Et}_{2} \mathrm{O}: \mathrm{PS} 1: 4 \rightarrow 2: 3\right)$ gave alcohol $\mathbf{2 7 4}^{104}(14.1 \mathrm{~g}, 55 \%)$ as a pale yellow oil; $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 5.98-5.85(2 \mathrm{H}, \mathrm{m}, \mathrm{HC}=\mathrm{CH}), 4.17-4.15(2 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{OH}$ ), 3.96-3.94 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{Br}$ ), $1.74(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 134.1$ $\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 127.3\left(\mathrm{CHCH}_{2} \mathrm{Br}\right), 62.4\left(\mathrm{CH}_{2} \mathrm{OH}\right), 32.0\left(\mathrm{CH}_{2} \mathrm{Br}\right)$.

## 1-Benzyl-3-methylpyrrolidin-2-one (280)

To a stirring solution of 1-benzylpyrrolidin-2-one ( $18.5 \mathrm{~mL}, 116 \mathrm{mmol}$ ) in THF ( 250 mL ) at $-78^{\circ} \mathrm{C}$ was added ${ }^{\mathrm{n}} \mathrm{BuLi}(1.6 \mathrm{M}$ in hexanes, $87 \mathrm{~mL}, 139 \mathrm{mmol})$ and the mixture stirred for 30 min . MeI ( $14.4 \mathrm{~mL}, 231 \mathrm{mmol}$ ) was added slowly and after 30 min at -78 ${ }^{\circ} \mathrm{C}$, the mixture was allowed to warm to room temperature and stirred at room temperature for 2 h . The reaction mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}(250 \mathrm{~mL})$ then extracted with EtOAc $(3 \times 250 \mathrm{~mL})$. The organic extracts were washed with brine
$(2 \times 250 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated and purified by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS $1: 4 \rightarrow 2: 3$ ) to provide the methylated product $280(19.9 \mathrm{~g}, 91 \%)$ as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 2968, 2931, $2874(\mathrm{CH}), 1683(\mathrm{C}=\mathrm{O}), 1429 ; \delta_{\mathrm{H}}$ ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.34-7.19 ( $5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}$ ), $4.46(1 \mathrm{H}, \mathrm{d}, J 14.7)$ and $4.42(1 \mathrm{H}, \mathrm{d}, J$ 14.7, $\mathrm{NCH}_{2} \mathrm{Ph}$ ), 3.19-3.13 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}$ ), 2.56-2.45 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHMe}$ ), 2.25-2.15 ( 1 H , $\mathrm{m})$ and $1.65-1.54\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 1.23\left(3 \mathrm{H}, \mathrm{d}, J 7.1, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 177.3(\mathrm{C}=\mathrm{O}), 136.6$ (aromatic C), 128.5, 128.0, $127.4(5 \times \operatorname{aromatic} \mathrm{CH}), 46.6$ $\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 44.5\left(\mathrm{BnNCH}_{2}\right), 36.6(\mathrm{CHMe}), 27.0\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 16.3\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+)$ $190\left(\mathrm{MH}^{+}, 100\right), 175$ (18); HRMS (CI+) calcd for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{NO}\left(\mathrm{MH}^{+}\right)$190.1232, found 190.1228.

## 1-Benzyl-3-methylpyrrolidine-2-thione (281)

From $\mathrm{P}_{4} \mathrm{~S}_{10}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}:{ }^{102}$
A solution of $\mathrm{P}_{4} \mathrm{~S}_{10}(16.2 \mathrm{~g}, 36.4 \mathrm{mmol})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(3.86 \mathrm{~g}, 36.4 \mathrm{mmol})$ in THF ( 350 mL ) was stirred vigorously for 15 min , followed by addition of lactam $\mathbf{2 8 0}(4.59 \mathrm{~g}, 24.3$ mmol ) in THF ( 20 mL ). After $40 \mathrm{~h}, 10 \%$ aqueous $\mathrm{Na}_{3} \mathrm{PO}_{4}(200 \mathrm{~mL})$ was slowly added, and the mixture stirred for 10 min . The product was then extracted with EtOAc ( $3 \times 100$ $\mathrm{mL})$, washed with brine $(2 \times 200 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 1: 9\right.$ then $2: 3$ to recover starting material) afforded the amide starting material ( $1.31 \mathrm{~g}, 28 \%$ ) and thiolactam 281 $(2.18 \mathrm{~g}, 55 \%)$ as a pale yellow oil.

## From heating with $P_{4} S_{10}$ :

A solution of lactam $280(9.74 \mathrm{~g}, 51.5 \mathrm{mmol})$ and $\mathrm{P}_{4} \mathrm{~S}_{10}(12.6 \mathrm{~g}, 28.3 \mathrm{mmol})$ in DCM $(250 \mathrm{~mL}$ ) was heated at reflux for 20 h . After cooling to room temperature, the reaction was quenched with $\mathrm{H}_{2} \mathrm{O}(200 \mathrm{~mL})$ and stirred for 10 min . The product was extracted with DCM $(3 \times 200 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 19 \rightarrow 1: 9\right)$ afforded thiolactam $281(9.09 \mathrm{~g}, 86 \%)$ as a pale yellow oil.

From Lawesson's reagent ${ }^{103}$ :
A solution of lactam $280(16.2 \mathrm{~g}, 85.6 \mathrm{mmol})$ and Lawesson's reagent ( $20.8 \mathrm{~g}, 51.4$ mmol) in THF ( 400 mL ) was heated at $40{ }^{\circ} \mathrm{C}$ for 2 h . After cooling to room temperature, the reaction mixture was quenched by addition of $\mathrm{H}_{2} \mathrm{O}(250 \mathrm{~mL})$, then stirred for 10 min . The organic products were extracted with EtOAc $(3 \times 200 \mathrm{~mL})$, washed with brine $(250 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration followed by filtration through a short plug of silica gel, eluting with EtOAc:PS 2:3, removed the polar impurities. Further purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:19 $\rightarrow 1: 9$ ) provided thiolactam $281(16.0 \mathrm{~g}, 91 \%)$ as a pale yellow oil.
$v_{\text {max }} / \mathrm{cm}^{-1}$ (film) 2966, 2927, $2872(\mathrm{CH}), 1452,1232(\mathrm{C}=\mathrm{S}) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.38-$ $7.24(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.04(1 \mathrm{H}, \mathrm{d}, J 14.5)$ and $4.95\left(1 \mathrm{H}, \mathrm{d}, J 14.5, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.55-3.40$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 3.02-2.88(1 \mathrm{H}, \mathrm{m}, \mathrm{CHMe}), 2.33-2.21(1 \mathrm{H}, \mathrm{m})$ and $1.69-1.55(1 \mathrm{H}, \mathrm{m}$, $\mathrm{BnNCH}_{2} \mathrm{CH}_{2}$ ), $1.39\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 206.7(\mathrm{C}=\mathrm{S}), 135.2$ (aromatic C), 128.8, 128.2, $128.0(5 \times$ aromatic CH$), 51.9$ and $51.8\left(\mathrm{PhCH}_{2} \mathrm{NCH}_{2}\right), 48.9$ (CHMe), $28.3\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 19.5\left(\mathrm{CH}_{3}\right) ; ~ m / z(\mathrm{CI}+) 234\left(\mathrm{M}\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)^{+}, 23 \%\right), 206\left(\mathrm{MH}^{+}\right.$, 100); HRMS (CI+) calcd for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{NS}\left(\mathrm{MH}^{+}\right)$206.1003, found 206.1005.
(3RS,2'SR)-1-Benzyl-3-(1-hydroxybut-3-en-2-yl)-3-methylpyrrolidine-2-thione (282)

A solution of thiolactam $281(13.6 \mathrm{~g}, 66.4 \mathrm{mmol})$ and allylic bromide $274(11.2 \mathrm{~g}, 74.3$ $\mathrm{mmol})$ in $\mathrm{MeCN}(10 \mathrm{~mL})$ was stirred at room temperature for 4 d . After dilution with further $\mathrm{MeCN}(350 \mathrm{~mL})$ the mixture was heated to $40{ }^{\circ} \mathrm{C}$ then $\mathrm{Et}_{3} \mathrm{~N}(10.2 \mathrm{~mL}, 73.1$ mmol ) was added. After 6 h , the mixture was cooled to room temperature, diluted with DCM ( 750 mL ) and washed with $10 \%$ aqueous citric acid $(2 \times 150 \mathrm{~mL})$, brine ( 150 mL ) and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; EtOAc:PS $1: 9 \rightarrow 3: 7$ ) afforded thiolactam starting material ( $0.41 \mathrm{~g}, 3 \%$ ) and the desired product $282(13.7 \mathrm{~g}, 75 \%)$ as a pale yellow solid; m.p. $=49-50{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr})$ 3337 (br, OH), 2872 (CH), 1504, 1448, 1232 (C=S); $\delta_{H}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ) 7.37-7.27

Found C: 69.6, H: 7.9, N: 5.0.
(3RS,2'SR)-1-Benzyl-3-(1-hydroxybut-3-en-2-yl)-3-methylpyrrolidin-2-one (283)

From oxidation with mCPBA: ${ }^{107}$
To a stirring solution of thiolactam $282(13.7 \mathrm{~g}, 50.0 \mathrm{mmol})$ in DCM $(600 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $m$ CPBA ( $70 \%$ by weight, $27.7 \mathrm{~g}, 112 \mathrm{mmol}$ ) in 0.25 eq. portions ( 3.1 g ) every 10 min . After a further 1 h at $0^{\circ} \mathrm{C}$, the reaction was warmed to room temperature, poured into saturated $\mathrm{NaHCO}_{3}(400 \mathrm{~mL})$ and the organic layer removed. Further extraction with DCM $(2 \times 400 \mathrm{~mL})$ followed by drying $\left(\mathrm{MgSO}_{4}\right)$, concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 2:3 $\rightarrow 4: 1$ ) afforded lactam 283 $(12.0 \mathrm{~g}, 93 \%)$ as a white solid; m.p. $=53-55^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 3371$ (br, OH$), 2862$ $(\mathrm{CH}), 1676(\mathrm{C}=\mathrm{O}), 1496,1450 ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.35-7.16(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.78$ ( $1 \mathrm{H}, \mathrm{dt}, J 17.0,10.0, H \mathrm{C}=\mathrm{CH}_{2}$ ), 5.21-5.14 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{HC}=\mathrm{CH}_{2}$ ), $4.45(1 \mathrm{H}, \mathrm{d}, J 14.7)$ and $4.40\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.97(1 \mathrm{H}, \mathrm{br}$ s, OH$), 3.90(1 \mathrm{H}, \mathrm{ddd}, J 11.3,4.4,1.6)$ and $3.62\left(1 \mathrm{H}, \mathrm{dd}, J 11.3,4.4, \mathrm{CH}_{2} \mathrm{OH}\right), 3.23-3.10\left(2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.26(1 \mathrm{H}, \mathrm{dt}, J 9.9,4.4$, $\left.\mathrm{CHCH}_{2} \mathrm{OH}\right), 2.13(1 \mathrm{H}, \mathrm{dt}, J 12.8,8.5)$ and $1.62(1 \mathrm{H}, \mathrm{ddd}, J 12.8,7.9,3.5$, $\left.\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 1.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.8(\mathrm{C}=\mathrm{O}), 136.2\left(\mathrm{HC=} \mathrm{CH}_{2}\right)$, 136.1 (aromatic C), 128.7, 128.1, $127.7(5 \times \operatorname{aromatic} \mathrm{CH}), 119.2(\mathrm{HC=CH}), 63.0$
$\left(\mathrm{CH}_{2} \mathrm{OH}\right), 53.1\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 47.0\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 46.8(\mathrm{CMe}), 44.1\left(\mathrm{BnNCH}_{2}\right), 29.7$ ( $\mathrm{BnNCH}_{2} \mathrm{CH}_{2}$ ), $22.8\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 260\left(\mathrm{MH}^{+}, 100 \%\right), 242(32), 229(17), 190(45)$, 91 (28); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{NO}_{2}\left(\mathrm{MH}^{+}\right)$260.1645, found 260.1640; Elemental analysis: calcd for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{2} \mathrm{C}: 74.1, \mathrm{H}: 8.2, \mathrm{~N}: 5.4$. Found C: 74.0, H: 8.2, $\mathrm{N}: 5.3$.

From methylation with MeI under aqueous conditions: ${ }^{105}$
A solution of thiolactam $282(0.20 \mathrm{~g}, 0.73 \mathrm{mmol}), \mathrm{MeI}(0.23 \mathrm{~mL}, 3.6 \mathrm{mmol})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$ $(0.20 \mathrm{~g}, 1.5 \mathrm{mmol})$ in THF $(8 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$ was stirred at room temperature for 8 d . Additional MeI ( $0.45 \mathrm{~mL}, 7.2 \mathrm{mmol}$ ), THF ( 8 mL ) and $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$ were added and the mixture stirred for a further 6 d . The products were then extracted with DCM $(2 \times$ 50 mL ), washed with brine ( 50 mL ) and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} \quad 1: 9 \rightarrow 1: 1\right)$ afforded thiolactam starting material ( $0.01 \mathrm{~g}, 7 \%$ ), the desired product $283(0.14 \mathrm{~g}, 72 \%)$, and the 1-iodobut-3-en-2yl analogue $284(0.04 \mathrm{~g}, 14 \%)$ as a white solid.

## $N$-Benzyl-3-(1-iodobut-3-en-2-yl)-3-methylpyrrolidin-2-one (284)

Iodide product $(0.04 \mathrm{~g}, 14 \%)$ as a white solid; m.p. $=108-109{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2880$ $(\mathrm{CH}), 1680(\mathrm{C}=\mathrm{O}), 1495,1427,1360,1184\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.31-7.18$ $(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.40\left(1 \mathrm{H}, \mathrm{dt}, J 17.0,10.0, H \mathrm{C}=\mathrm{CH}_{2}\right), 5.26(1 \mathrm{H}, \mathrm{dd}, J 10.2,1.3)$ and $5.14\left(1 \mathrm{H}, \mathrm{d}, J 16.9, \mathrm{HC=} \mathrm{CH}_{2}\right), 4.41\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.40(1 \mathrm{H}, \mathrm{dd}, J 9.5,2.6, \mathrm{CHHI})$, 3.16-3.05 ( $3 \mathrm{H}, \mathrm{m}, \mathrm{CHHI}$ and $\mathrm{BnNCH}_{2}$ ), $2.63\left(1 \mathrm{H}, \mathrm{td}, J 10.5,2.6, \mathrm{CHCH}_{2} \mathrm{I}\right), 2.03(1 \mathrm{H}$, ddd, $J$ 13.2, 9.0, 8.0) and $1.59\left(1 \mathrm{H}, \mathrm{ddd}, J 13.2,8.0,3.9 \mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 1.18(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 177.0(\mathrm{C}=\mathrm{O}), 136.3$ (aromatic C), $136.0\left(\mathrm{HC}_{\mathrm{C}}=\mathrm{CH}_{2}\right), 128.7$, 128.1, $127.7(5 \times$ aromatic CH$), 120.4\left(\mathrm{HC=}=\mathrm{CH}_{2}\right), 53.4\left(\mathrm{CHCH}_{2} \mathrm{I}\right), 47.7(\mathrm{CMe}), 46.8$ $\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 43.4\left(\mathrm{BnNCH}_{2}\right), 27.8\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 23.7\left(\mathrm{CH}_{3}\right), 7.3\left(\mathrm{CH}_{2} \mathrm{I}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 271$ ( $\mathrm{MH}^{+}, 16 \%$ ), 270 (100), 244 (27), 242 (63), 189 (14), 125 (14); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NOI}\left(\mathrm{MH}^{+}\right) 370.0662$, found 370.0649; Elemental analysis: calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NOI}$ C: 52.0, H: $5.5, \mathrm{~N}: 3.8$. Found C: $52.2, \mathrm{H}: 5.6, \mathrm{~N}: 3.6$.

## 1-Benzyl-3-(buta-1,3-dien-2-yl)-3-methylpyrrolidin-2-one (287)

A stirring solution of iodide $284(0.20 \mathrm{~g}, 0.5 \mathrm{mmol})$ and $\mathrm{NaN}_{3}(0.11 \mathrm{~g}, 1.6 \mathrm{mmol})$ in DMSO ( 2 mL ) was heated at $60^{\circ} \mathrm{C}$ for 20 h . The reaction mixture was cooled to room temperature then diluted with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ and extracted with EtOAc ( $3 \times 10 \mathrm{~mL}$ ), which was subsequently washed with brine $(10 \mathrm{~mL})$ and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:19 $\rightarrow 1: 4$ ) provided an inseparable mixture of the title diene product 287 and azide 288 (vide infra) ( $0.12 \mathrm{~g}, \sim 85 \%$ combined yield) as a colourless oil; diagnostic peaks excluding those corresponding to azide 288 are quoted: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.33-7.18(5 \mathrm{H}, \mathrm{m}, 5 \times$ $\mathrm{ArH}), 6.25\left(1 \mathrm{H}\right.$, ddd, $\left.J 17.4,11.0,0.6, H \mathrm{C}=\mathrm{CH}_{2}\right), 5.33(1 \mathrm{H}, \mathrm{dd}, J 17.4,1.5, \mathrm{HC}=\mathrm{CHH})$, $5.28-5.25(1 \mathrm{H}, \mathrm{m}, \mathrm{MeCC}=\mathrm{CHH}), 5.06(1 \mathrm{H}, \mathrm{dd}, J 11.0,1.5, \mathrm{HC}=\mathrm{CHH}), 5.01(1 \mathrm{H}, \mathrm{s}$, $\mathrm{MeCC}=\mathrm{CH} H), 4.50-4.40\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.17-3.06\left(2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.23(1 \mathrm{H}$, ddd, $J 13.2,7.3,5.9$ ) and $1.76\left(1 \mathrm{H}, \mathrm{ddd}, J 13.0,7.5,6.4, \mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 1.34(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 176.9(\mathrm{C}=\mathrm{O}), 148.1\left(\mathrm{MeCC}=\mathrm{CH}_{2}\right)$, 136.5 (aromatic C ), $136.0\left(\mathrm{HC}_{\mathrm{CH}}^{2}\right), 128.6,128.1,127.5(5 \times$ aromatic CH$), 115.8\left(\mathrm{HC}=\mathrm{CH}_{2}\right), 112.8$ $\left(\mathrm{MeCC}=\mathrm{CH}_{2}\right), 48.6(\mathrm{CMe}), 46.9\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 43.3\left(\mathrm{BnNCH}_{2}\right), 32.2\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 22.6$ $\left(\mathrm{CH}_{3}\right) ; m / z$ (ESI+) 285 (azide 288, 19\%), $264\left(\mathrm{MNa}^{+}, 13\right), 242\left(\mathrm{MH}^{+}, 100\right)$; HRMS (ESI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}\left(\mathrm{MH}^{+}\right) 242.1539$, found 242.1546 .
(3RS,2'SR)-1-Benzyl-3-(1-methanesulfonyloxybut-3-en-2-yl)-3-methylpyrrolidin-2one (289)

To a stirring solution of alcohol $283(0.29 \mathrm{~g}, 1.1 \mathrm{mmol})$ in $\mathrm{DCM}(12 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{Et}_{3} \mathrm{~N}(0.31 \mathrm{~mL}, 2.3 \mathrm{mmol})$ and $\mathrm{MsCl}(0.17 \mathrm{~mL}, 2.3 \mathrm{mmol})$. After 1 h , the reaction
was warmed to room temperature, diluted with DCM ( 30 mL ), washed successively with $\mathrm{H}_{2} \mathrm{O}(2 \times 10 \mathrm{~mL})$ and brine $(2 \times 10 \mathrm{~mL})$, and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration provided the mesylate 289 as a colourless oil, which can be used without further purification. If desired, the oil can be purified by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; EtOAc:PS 1:4 $\rightarrow 2: 3$ ) to provide the mesylate $(0.36 \mathrm{~g}, 94 \%)$ as a white solid; m.p. $=69-$ $70{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}$ ( $\mathrm{CHCl}_{3}$ cast) 2966, 2928, $2876(\mathrm{CH}), 1680(\mathrm{C}=\mathrm{O}), 1501,1435,1340$, $1180\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.36-7.14(5 \mathrm{H}, \mathrm{m}, 5 \mathrm{x} \mathrm{ArH}), 5.65-5.55(1 \mathrm{H}, \mathrm{m}$, $\left.H \mathrm{C}=\mathrm{CH}_{2}\right)$, 5.29-5.20 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{HC=}=\mathrm{CH}_{2}$ ), $4.47(1 \mathrm{H}, \mathrm{d}, J 14.6, \mathrm{NCHHPh})$, 4.38-4.27 (3H, $\mathrm{m}, \mathrm{NCHHPh}$ and $\left.\mathrm{CH}_{2} \mathrm{OMs}\right), 3.17-3.09\left(2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{SO}_{2} \mathrm{CH}_{3}\right), 2.66$ ( 1 H, ddd, $\left.J 13.3,8.3,5.0, \mathrm{CHCH}_{2} \mathrm{OMs}\right), 2.12-2.03(1 \mathrm{H}, \mathrm{m})$ and $1.63(1 \mathrm{H}$, ddd, $J 13.0$, $7.4,4.5, \mathrm{BnNCH}_{2} \mathrm{CH}_{2}$ ), $1.17\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CCH}_{3}\right) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 177.0(\mathrm{C}=\mathrm{O}), 136.3$ (aromatic C), $133.9\left(\mathrm{HC}=\mathrm{CH}_{2}\right), 128.8,128.1,127.7(5 \times$ aromatic CH$), 120.8$ $\left(\mathrm{HC}=\mathrm{CH}_{2}\right), 70.0\left(\mathrm{CH}_{2} \mathrm{OMs}\right), 49.8\left(\mathrm{CHCH}_{2} \mathrm{OMs}\right), 46.8\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 45.6(\mathrm{CMe}), 43.5$ $\left(\mathrm{BnNCH}_{2}\right), 37.3\left(\mathrm{SO}_{2} \mathrm{CH}_{3}\right), 28.5\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 23.2\left(\mathrm{CCH}_{3}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{CI}+) 338\left(\mathrm{MH}^{+}\right.$, 9\%), 324 (15), 278 (30), 242 (100), 190 (70), 91 (42); HRMS (CI+) calcd for $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{NO}_{4} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$338.1426, found 338.1416; Elemental analysis: calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{4} \mathrm{~S}$ C: 60.5, H: 6.9, N: 4.2. Found C: 60.3, H: 6.7, N: 4.1.
(3RS,2'SR)-3-(1-Azidobut-3-en-2-yl)-1-benzyl-3-methylpyrrolidin-2-one (288)

Using the procedure previously described, alcohol $283(11.9 \mathrm{~g}, 45.9 \mathrm{mmol})$ provided 17.7 g of crude mesylate 289. This was treated with $\mathrm{NaN}_{3}(8.9 \mathrm{~g}, 138 \mathrm{mmol})$ in DMSO ( 50 mL ) and stirred at $60{ }^{\circ} \mathrm{C}$ for 21 h . The reaction mixture was cooled to room temperature, then diluted with $\mathrm{H}_{2} \mathrm{O}(400 \mathrm{~mL})$ and the organic material extracted with EtOAc $(4 \times 50 \mathrm{~mL})$. Subsequent washing with brine $(50 \mathrm{~mL})$ and drying $\left(\mathrm{MgSO}_{4}\right)$, followed by concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; $\mathrm{EtOAc}: \mathrm{PS}$ $1: 9 \rightarrow 1: 4)$ provided azide 288 ( $11.3 \mathrm{~g}, 87 \%$ ) as white crystals; m.p. $=40-42{ }^{\circ} \mathrm{C}$; $v_{\text {max }} / \mathrm{cm}^{-1}(\mathrm{KBr}) 2968,2893(\mathrm{CH}), 2085\left(\mathrm{~N}_{3}\right), 1680(\mathrm{C}=\mathrm{O}), 1497,1433(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}(500$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.34-7.14(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.57\left(1 \mathrm{H}, \mathrm{dt}, J 17.4,9.8, H \mathrm{C}=\mathrm{CH}_{2}\right), 5.28-$ $5.23\left(2 \mathrm{H}, \mathrm{m}, \mathrm{HC}=\mathrm{CH}_{2}\right), 4.43(1 \mathrm{H}, \mathrm{d}, J 14.7)$ and $4.40\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.44$

(3aRS,4SR,6aRS)-1-Benzyl-3a-methyl-4-vinyloctahydropyrrolo[2,3-b]pyrrole (291)

A solution of azide $288(2.00 \mathrm{~g}, 7.0 \mathrm{mmol})$ and $\mathrm{PBu}_{3}(3.2 \mathrm{~mL}, 12.7 \mathrm{mmol})$ in THF ( 60 mL ) was stirred at room temperature for 1 h then $\mathrm{LiAlH}_{4}(0.27 \mathrm{~g}, 7.0 \mathrm{mmol})$ was slowly added. After 1 h , another portion of $\mathrm{LiAlH}_{4}(0.27 \mathrm{~g}, 7.0 \mathrm{mmol})$ was added and stirring was continued for a further 1 h . After quenching by addition of 0.5 M aqueous sodium potassium tartrate $(60 \mathrm{~mL})$ the mixture was stirred for 30 min . The product was then extracted with EtOAc $(3 \times 60 \mathrm{~mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 60 \mathrm{~mL})$ and brine $(2 \times 60$ $\mathrm{mL})$, then dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated. The $\mathrm{O}=\mathrm{PBu}_{3}$ by-product was subsequently removed by dilution with $\mathrm{DCM}(20 \mathrm{~mL})$ and extracting the amine material with 2 M $\mathrm{HCl}(3 \times 20 \mathrm{~mL})$. Basification to pH 11 with 3 M NaOH , cooling with an ice bath, was followed by extraction of the materials into EtOAc $(3 \times 50 \mathrm{~mL})$, which was washed with brine ( 50 mL ) and dried $\left(\mathrm{MgSO}_{4}\right)$. Further purification by flash chromatography ( $\mathrm{SiO}_{2} ; \mathrm{MeOH}: \mathrm{DCM} 1: 49 \rightarrow 1: 9$ ) provided the bicycle $291(1.27 \mathrm{~g}, 76 \%)$ as a pale yellow oil; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.37-7.20(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.74$ ( 1 H , ddd, J 17.1, 10.7, 7.4, $\left.H C=\mathrm{CH}_{2}\right), 5.10-5.02\left(2 \mathrm{H}, \mathrm{m}, \mathrm{HC}=\mathrm{CH}_{2}\right), 3.92(1 \mathrm{H}, \mathrm{d}, J 12.9, \mathrm{NCHHPh}), 3.79(1 \mathrm{H}, \mathrm{s}$, NCHN), 3.68 ( $1 \mathrm{H}, \mathrm{d}, J$ 13.0, NCHHPh), 3.03-2.93 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}$ ), 2.87-2.80 ( 1 H , $\mathrm{m})$ and 2.51-2.43 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{HNCH}_{2}\right), 2.31\left(1 \mathrm{H}, \mathrm{dt}, J 10.4,7.4, \mathrm{HNCH}_{2} \mathrm{CH}\right), 1.82(1 \mathrm{H}$, ddd, $J 12.3,10.4,7.1$ ) and $1.21\left(1 \mathrm{H}\right.$, ddd, $\left.J 12.3,5.5,2.0, \mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 1.15(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 139.1$ (aromatic C), $135.1\left(\mathrm{HC}=\mathrm{CH}_{2}\right), 128.8,128.2,126.9$
( $5 \times$ aromatic CH ), $116.9(\mathrm{HC=CH} 2), 90.1(\mathrm{NCHN}), 57.7\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 54.4\left(\mathrm{HNCH}_{2} \mathrm{CH}\right)$, $51.9(\mathrm{CMe}), 51.3\left(\mathrm{HNCH}_{2}\right), 49.3\left(\mathrm{BnNCH}_{2}\right), 32.0\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 25.1\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}$ (CI+) $243\left(\mathrm{MH}^{+}, 100 \%\right), 214$ (34), 173 (27); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{23} \mathrm{~N}_{2}\left(\mathrm{MH}^{+}\right)$ 243.1856, found 243.1854.
(3RS,2'SR)-3-(1-Aminobut-3-en-2-yl)-1-benzyl-3-methylpyrrolidin-2-one (290)

## Failed transformation of carboxylic acid into diazoketone:

(3aRS,8aSR)-6-Benzyl-octahydro-1-hydroxy-8a-methyl-2-(4-toluenesulfonyl)pyrrolo[3,4-d]azepin-5(1H)-one (301)

Produced from attempts to produce diazoketone, by activation of carboxylic acid for treatment with $\mathrm{TMSCHN}_{2}$ :

To a stirring solution of acid $299(0.11 \mathrm{~g}, 0.25 \mathrm{mmol})$ in THF $(2 \mathrm{~mL})$ at $-10{ }^{\circ} \mathrm{C}$ was added $\mathrm{Et}_{3} \mathrm{~N}(0.046 \mathrm{~mL}, 0.33 \mathrm{mmol})$ and ${ }^{\mathrm{i}} \mathrm{BuOCOCl}(0.043 \mathrm{~mL}, 0.33 \mathrm{mmol})$. After 1 h , $\mathrm{TMSCHN}_{2}\left(2 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 0.25 \mathrm{~mL}, 0.50 \mathrm{mmol}\right)$ was added, and after an additional 2 h , further $\mathrm{TMSCHN}_{2}\left(2 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 0.25 \mathrm{~mL}, 0.50 \mathrm{mmol}\right)$ was added before warming the mixture to room temperature. After 16 h , the mixture was concentrated and purified by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 4 \rightarrow 3: 2\right)$ to afford impure lactam $301(0.066 \mathrm{~g}$, $<62 \%$ ) as a white solid; $v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 3350(\mathrm{br}, \mathrm{OH}), 2927,2881(\mathrm{CH}), 1630(\mathrm{C}=\mathrm{O})$, 1342, $1169\left(\mathrm{SO}_{2}\right)$; diagnostic peaks are quoted: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.74(2 \mathrm{H}, \mathrm{d}, J$ $8.1,2 \times \mathrm{S}-\rho \mathrm{CH}), 7.35-7.10(7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}), 4.86(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{NCHHPh}), 4.80(1 \mathrm{H}$, s, $\mathrm{NCH}(\mathrm{OH})$ ), 3.77 ( $1 \mathrm{H}, \mathrm{d}, ~ J 14.7$, NCHHPh), 3.64-3.55 (1H, m, TsNCHH), 3.38 ( 1 H ,

## Methyl-((3RS,3aSR,6aRS)-6-benzyl-3a-methyl-1-(4-toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrol-3-yl)acetate (304)

Isolated when $\mathrm{TMSCHN}_{2}$ was added to unreacted carboxylic acid 299 that was not activated in the reaction mixture:

To a stirring solution of acid $299(0.07 \mathrm{~g}, 0.16 \mathrm{mmol})$ in $\mathrm{DCM}(1 \mathrm{~mL})$ at $-45^{\circ} \mathrm{C}$ was slowly added $(\mathrm{COCl})_{2}(0.017 \mathrm{~mL}, 0.20 \mathrm{mmol})$ and DMF $(\sim 0.001 \mathrm{~mL})$. After 15 min , the mixture was warmed to $-10^{\circ} \mathrm{C}$ and was treated with additional DMF ( $\sim 0.001 \mathrm{~mL}$ ), and after 3 h , further $(\mathrm{COCl})_{2}(0.017 \mathrm{~mL}, 0.20 \mathrm{mmol})$ and DMF $(\sim 0.001 \mathrm{~mL})$ were added. After $1 \mathrm{~h}, \mathrm{TMSCHN}_{2}\left(2 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 0.5 \mathrm{~mL}, 1.0 \mathrm{mmol}\right)$ was added, and after an additional 1 h , the mixture was warmed to room temperature. Concentration followed by purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 4\right)$ afforded methyl ester $304(0.036 \mathrm{~g}, 50 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 2955, $2926(\mathrm{CH}), 1738$ (C=O), 1599, 1447, 1344, $1159\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.76(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{S}-$ $o \mathrm{CH}), 7.33-7.18(7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}), 4.56(1 \mathrm{H}, \mathrm{s}, \mathrm{NCHN}), 4.09(1 \mathrm{H}, \mathrm{d}, J 13.8)$ and 3.99 $\left(1 \mathrm{H}, \mathrm{d}, J 13.8, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.86(1 \mathrm{H}, \mathrm{dd}, J 12.2,6.9, \mathrm{TsNCHH}), 3.62\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.02$ $(1 \mathrm{H}, \mathrm{t}, J 12.2, \mathrm{TsNCH} H), 2.68(1 \mathrm{H}, \mathrm{ddd}, J 11.8,7.5,4.3)$ and $2.62-2.56(1 \mathrm{H}, \mathrm{m}$, $\mathrm{BnNCH}_{2}$ ), $2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.23(1 \mathrm{H}, \mathrm{dd}, J 15.9,3.9)$ and $2.06(1 \mathrm{H}, \mathrm{dd}, J 15.9$, $\left.10.6, \mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Me}\right), 1.68\left(1 \mathrm{H}, \mathrm{dt}, J 12.5,7.5, \mathrm{BnNCH}_{2} \mathrm{CHH}\right), 1.60-1.51(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{TsNCH}_{2} \mathrm{CH}\right), 1.18\left(1 \mathrm{H}\right.$, ddd, $\left.J 12.4,6.5,4.5, \mathrm{BnNCH}_{2} \mathrm{CHH}\right), 0.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right)$; $\delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.3(\mathrm{C}=\mathrm{O}), 143.3,139.0,137.2(3 \times$ aromatic C$), 129.7,128.8$, 128.1, 127.3, $126.7(9 \times$ aromatic CH$), 90.5(\mathrm{NCHN}), 55.5\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 52.7\left(\mathrm{TsNCH}_{2}\right)$, $52.2(\mathrm{NCHCMe}), 51.8\left(\mathrm{OCH}_{3}\right), 50.2\left(\mathrm{BnNCH}_{2}\right), 43.8\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), 32.2\left(\mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Me}\right)$,
$30.7\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 24.2\left(\mathrm{NCHCCH}_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right) ; m / z(\mathrm{FAB}+) 465\left(\mathrm{MNa}^{+}, 22 \%\right)$, 199 (33), 173 (100); HRMS (FAB+) calcd for $\mathrm{C}_{24} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{SNa}\left(\mathrm{MNa}^{+}\right) 465.1834$, found 465.1809 .
(3RS,3aSR,6aRS)-6-Benzyl-3-(2-hydroxypropyl)-3a-methyl-1-(4-toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrole (309)

To a stirring solution of aldehyde $298(0.63 \mathrm{~g}, 1.5 \mathrm{mmol})$ in THF $(18 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added MeMgBr ( 1.0 M in THF, $3.1 \mathrm{~mL}, 3.1 \mathrm{mmol}$ ). The temperature was maintained at $0{ }^{\circ} \mathrm{C}$ for 15 min then the flask was stirred at room temperature for 3 h and quenched by addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}(20 \mathrm{~mL})$. The product was extracted into EtOAc $(3 \times 20$ mL ), washed with brine ( 20 mL ), and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 3: 7 \rightarrow 2: 3\right)$ afforded a $2: 3$ mixture of diastereoisomeric alcohols 309 ( $0.51 \mathrm{~g}, 78 \%$ ) as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 3449 (br, OH), 2982, $2877(\mathrm{CH}), 1454,1336,1157\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.76$ $(0.8 \mathrm{H}, \mathrm{d}, J 8.3)$ and $7.75(1.2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.32-7.18(7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}), 4.59$ ( $1 \mathrm{H}, \mathrm{s}, \mathrm{NCHN}$ ), 4.09-3.98 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{Ph}$ ), 3.79 ( $0.6 \mathrm{H}, \mathrm{dd}, J 12.2,6.7$ ) and 3.76 $(0.4 \mathrm{H}, \mathrm{dd}, J$ 12.2, $6.7, \mathrm{TsNCHH}), 3.67-3.61(0.4 \mathrm{H}, \mathrm{m})$ and $3.58(0.6 \mathrm{H}, \mathrm{q}, J 6.2$, $\mathrm{CH}(\mathrm{OH})), 3.00(0.6 \mathrm{H}, \mathrm{t}, J 12.1)$ and $2.96(0.4 \mathrm{H}, \mathrm{t}, J 12.1, \mathrm{TsNCH}), 2.69-2.63(1 \mathrm{H}, \mathrm{m})$ and $2.62-2.56\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.77-1.68(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{BnNCH}_{2} \mathrm{CHH}\right), 1.65(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 1.38-1.20\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}(\mathrm{OH})\right), 1.20-1.10(2 \mathrm{H}$, $\mathrm{m}, \mathrm{BnNCH}_{2} \mathrm{CHH}$ and $\left.\mathrm{TsNCH}_{2} \mathrm{CH}\right), 1.08(1.2 \mathrm{H}, \mathrm{d}, J 6.2)$ and $1.04(1.8 \mathrm{H}, \mathrm{d}, J 6.2$, $\left.\mathrm{CH}(\mathrm{OH}) \mathrm{CH}_{3}\right), 0.91(1.8 \mathrm{H}, \mathrm{s})$ and $0.89\left(1.2 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 143.2, 143.1, 139.1, 137.5, 137.4 ( $3 \times$ aromatic C), 129.6, 128.8, 128.1, 127.3, 127.2, 127.0, $126.7(9 \times$ aromatic CH$), 90.7,90.3(\mathrm{NCHN}), 67.6,66.2(\mathrm{CH}(\mathrm{OH})), 55.6$ $\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 53.2,52.7\left(\mathrm{TsNCH}_{2}\right), 52.8,52.5(\mathrm{NCHCMe}), 50.4,50.3\left(\mathrm{BnNCH}_{2}\right), 46.0$, $43.8\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right)$, 36.7, $36.3\left(\mathrm{CH}_{2} \mathrm{CH}(\mathrm{OH})\right)$, $30.7\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 24.6,24.3$ $\left(\mathrm{NCHCCH}_{3}\right), 24.0,23.9\left(\mathrm{CH}(\mathrm{OH}) \mathrm{CH}_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right) ; \mathrm{m} / z(\mathrm{ESI}+) 451\left(\mathrm{MNa}^{+}, 100 \%\right)$, 429 (83), 258 (56); HRMS (ESI+) calcd for $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{SNa}\left(\mathrm{MNa}^{+}\right)$451.2031, found 451.2036.
(3RS,3aSR,6aRS)-6-Benzyl-3a-methyl-3-(2-oxopropyl)-1-(4-toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrole (310)

To a solution of alcohol $309(0.46 \mathrm{~g}, 1.1 \mathrm{mmol})$ in $\mathrm{DCM}(25 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added pyridine ( $0.44 \mathrm{~mL}, 5.4 \mathrm{mmol}$ ), followed by DMP ( $1.1 \mathrm{~g}, 2.7 \mathrm{mmol}$ ). The reaction mixture was allowed to warm to room temperature, and after 5 h was quenched by addition of saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(25 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3}(25 \mathrm{~mL})$. After vigorously stirring for 30 min , the organic materials were extracted with DCM ( $3 \times 30$ mL ), washed with brine ( 30 mL ), and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 3:7 $\rightarrow 2: 3$ ) afforded methyl ketone $310(0.36 \mathrm{~g}, 79 \%)$ as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 2926, $2880(\mathrm{CH})$, $1715(\mathrm{C}=\mathrm{O}), 1599,1448,1348,1159\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.78(2 \mathrm{H}, \mathrm{d}, J 8.2,2$ $\times \mathrm{S}-o \mathrm{CH}), 7.35-7.18(7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}), 4.50(1 \mathrm{H}, \mathrm{s}, \mathrm{NCHN}), 4.08(1 \mathrm{H}, \mathrm{d}, J 13.8)$ and $4.00\left(1 \mathrm{H}, \mathrm{d}, J 13.8, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.88(1 \mathrm{H}, \mathrm{dd}, J 12.3,6.9)$ and $2.89(1 \mathrm{H}, \mathrm{t}, J 12.1$, $\left.\mathrm{TsNCH}_{2}\right), 2.65(1 \mathrm{H}, \mathrm{ddd}, J 9.0,7.5,4.6)$ and $2.61-2.54\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.39(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 2.34(1 \mathrm{H}, \mathrm{dd}, J 17.6,3.2)$ and $2.11\left(1 \mathrm{H}, \mathrm{dd}, J 17.6,10.5, \mathrm{CH}_{2} \mathrm{COMe}\right), 2.03$ $\left(\mathrm{COCH}_{3}\right), 1.66\left(1 \mathrm{H}, \mathrm{dt}, J 12.5,7.5, \mathrm{BnNCH}_{2} \mathrm{CHH}\right), 1.54-1.46\left(1 \mathrm{H}, \mathrm{m}, \mathrm{TsNCH}_{2} \mathrm{CH}\right)$, 1.17 ( 1 H , ddd, $\left.J 12.5,6.5,4.6, \mathrm{BnNCH}_{2} \mathrm{CH} H\right), 0.82\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}(125 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 206.5(\mathrm{C}=\mathrm{O}), 143.3,139.0,137.0(3 \times$ aromatic C$)$, 129.7, 128.8, 128.1, 127.4, $126.7(9 \times$ aromatic CH$), 90.2(\mathrm{NCHN}), 55.3\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 52.6\left(\mathrm{TsNCH}_{2}\right), 52.1$ $(\mathrm{NCHCMe}), \quad 50.1 \quad\left(\mathrm{BnNCH}_{2}\right), \quad 42.7 \quad\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), \quad 41.4 \quad\left(\mathrm{CH}_{2} \mathrm{COMe}\right), \quad 31.0$ $\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 30.1\left(\mathrm{O}=\mathrm{CCH}_{3}\right), 24.4\left(\mathrm{NCHCCH}_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right) ; \mathrm{m} / \mathrm{z}$ (ESI+) 449 ( $\mathrm{MNa}^{+}, 45 \%$ ), $427\left(\mathrm{MH}^{+}, 100\right), 242$ (39); HRMS (ESI+) calcd for $\mathrm{C}_{24} \mathrm{H}_{31} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$ 427.2055, found 427.2047.

## Ethyl 4-((3RS,3aSR,6aSR)-6-benzyl-3a-methyl-1-(4-

 toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrol-3-yl)-2-diazo-3-hydroxybutanoate (312) ${ }^{135}$

Ethyl diazoacetate ( $0.11 \mathrm{~mL}, 1.1 \mathrm{mmol}$ ) and DBU ( $0.03 \mathrm{~mL}, 0.2 \mathrm{mmol}$ ) were added to a solution of aldehyde $298(0.22 \mathrm{~g}, 0.53 \mathrm{mmol})$ in $\mathrm{MeCN}(5 \mathrm{~mL})$. To a solution of aldehydes $339(0.03 \mathrm{~g}, 0.05 \mathrm{mmol})$ in $\mathrm{MeOH}(0.5 \mathrm{~mL})$ was added $\mathrm{AcOH}(0.012 \mathrm{~mL}, 0.22 \mathrm{mmol})$ and the mixture stirred at room temperature for 16 h , then at $65{ }^{\circ} \mathrm{C}$ for a further 30 h . After cooling to room temperature, the mixture was concentrated, diluted with EtOAc ( 5 mL ) and washed with saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$.

The organic materials were extracted from the aqueous layer with EtOAc ( $2 \times 5 \mathrm{~mL}$ ), and the combined organic extracts were washed with brine $(5 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:9 $\rightarrow 1: 4$ ) afforded impure tricycle $346(0.017 \mathrm{~g},<47 \%)$ as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) $3412(\mathrm{OH}), 2926(\mathrm{CH}), 1599,1456,1336,1159\left(\mathrm{SO}_{2}\right)$; diagnostic peaks are quoted: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.79(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.37-7.20(7 \mathrm{H}, \mathrm{m}, 7 \times$ $\mathrm{ArH}), 5.30(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}(\mathrm{OH})), 4.04(1 \mathrm{H}, \mathrm{d}, J 13.1)$ and $3.47\left(1 \mathrm{H}, \mathrm{d}, J 13.1, \mathrm{NCH}_{2} \mathrm{Ph}\right)$, 3.24-3.18 ( $1 \mathrm{H}, \mathrm{m}$ ) and $3.03(1 \mathrm{H}, \mathrm{dd}, J 11.3,1.5$, TsNCHH), $2.90(1 \mathrm{H}, \mathrm{dd}, J 9.0,7.3)$ and 2.46-2.39 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}$ ), $2.42\left(\mathrm{ArCH}_{3}\right), 2.33(1 \mathrm{H}, \mathrm{s}, \mathrm{BnNCHCMe}), 2.11(1 \mathrm{H}, \mathrm{d}, J$ 11.8, $\mathrm{CHHC}(\mathrm{OTBS})$ ), $1.75-1.50\left(4 \mathrm{H}, \mathrm{BnNCH}_{2} \mathrm{CHH}, \mathrm{TsNCH}_{2} \mathrm{CH}, \mathrm{CHHC}(\mathrm{OTBS})\right.$ and $\mathrm{OH}), 1.46\left(1 \mathrm{H}, \mathrm{dd}, J 12.5,5.8, \mathrm{BnNCH}_{2} \mathrm{CH} H\right), 0.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right), 0.86(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.15,0.11\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 143.3,139.0,136.7(3 \times$ aromatic C), 129.4, 128.6, 128.4, 127.9, $127.2(9 \times$ aromatic CH$), 84.2(\mathrm{NCH}(\mathrm{OH}))$, 79.3 ( $C(\mathrm{OTBS})$ ), $76.4(\mathrm{BnNCHCMe}), 62.3\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 52.8\left(\mathrm{BnNCH}_{2}\right), 49.3$ $(\mathrm{NCHCMe}), 44.0\left(\mathrm{TsNCH}_{2}\right), \quad 41.1\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), \quad 39.4\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), \quad 33.7$ $\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OTBS})\right), 26.1\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right), 21.4\left(\mathrm{NCHCCH}_{3}\right), 18.5\left(\mathrm{CMe}_{3}\right),-3.9$, -4.3 ( $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right) ; m / z(\mathrm{EI}+) 556\left(\mathrm{M}^{+}, 2 \%\right), 499$ (67), 269 (86), 95 (100); HRMS (EI+) calcd for $\mathrm{C}_{30} \mathrm{H}_{44} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{SSi}\left(\mathrm{M}^{+}\right) 556.2786$, found 556.2781.
(3RS,3aSR,6aRS)-6-Benzyl-3-(3-methoxyallyl)-3a-methyl-1-(4-toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrole (356) ${ }^{145}$

To a suspension of (methoxymethyl)triphenylphosphonium chloride ( $0.20 \mathrm{~g}, 0.58$ $\mathrm{mmol})$ in THF ( 2 mL ) at $-10^{\circ} \mathrm{C}$ was added $\mathrm{KO}^{\mathrm{t}} \mathrm{Bu}(0.065 \mathrm{~g}, 0.58 \mathrm{mmol})$. The brightly orange coloured suspension was stirred at $-10^{\circ} \mathrm{C}$ for 30 min then a solution of aldehyde $298(0.060 \mathrm{~g}, 0.15 \mathrm{mmol})$ in THF ( 1 mL and $2 \times 0.5 \mathrm{~mL}$ washes) was added via cannula. The temperature was maintained at $0{ }^{\circ} \mathrm{C}$ for 30 min and then warmed to room temperature. $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ was added, and then the organic materials were extracted with EtOAc $(3 \times 5 \mathrm{~mL})$, washed with brine $(5 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and
purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 9 \rightarrow 1: 4\right)$ afforded a $3: 2 \mathrm{E}: \mathrm{Z}$ mixture of olefins $356(0.038 \mathrm{~g}, 59 \%)$ as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 2930 $(\mathrm{CH}), 1720,1660,1599,1454,1344,1157\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.74(1.2 \mathrm{H}, \mathrm{d}$, $J 8.3$ ) and $7.73(0.8 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-o \mathrm{CH}), 7.35-7.18(7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}), 6.17(0.6 \mathrm{H}, \mathrm{d}$, $J 12.5)$ and $5.83(0.4 \mathrm{H}, \mathrm{dt}, J 6.2,1.3, \mathrm{CH}(\mathrm{OMe})), 4.62(0.6 \mathrm{H}, \mathrm{s})$ and $4.59(0.4 \mathrm{H}, \mathrm{s}$, NCHN), 4.44 ( 0.6 H , ddd, $J$ 12.6, 8.0, $6.9, H_{(\text {major })} \mathrm{C}=\mathrm{CH}(\mathrm{OMe})$ ), 4.11-4.05 (1.4H, m, $H_{\text {(minor })} \mathrm{C}=\mathrm{CH}(\mathrm{OMe})$ and NCHHPh$), 3.98(0.6 \mathrm{H}, \mathrm{d}, J 13.8)$ and $3.97(0.4 \mathrm{H}, \mathrm{d}, J 13.8$, $\mathrm{NCH} H \mathrm{Ph})$, 3.69-3.62 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{TsNCHH}$ ), $3.52(1.2 \mathrm{H}, \mathrm{s})$ and $3.45\left(1.8 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.98$ $(0.4 \mathrm{H}, \mathrm{t}, J 12.0)$ and $2.92(0.6 \mathrm{H}, \mathrm{t}, J 12.0, \mathrm{TsNCH}), 2.72-2.65(1 \mathrm{H}, \mathrm{m})$ and 2.61-2.55 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.94-1.84(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}=\mathrm{CH}), 1.84-1.73$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2} \mathrm{CHH}\right), 1.71-1.63(1 \mathrm{H}, \mathrm{m}, \mathrm{CH} H \mathrm{CH}=\mathrm{CH}), 1.25-1.15(2 \mathrm{H}, \mathrm{m}$, TsNCH ${ }_{2} \mathrm{CH}$ and $\left.\mathrm{BnNCH}_{2} \mathrm{CH} H\right), 0.93(1.8 \mathrm{H}, \mathrm{s})$ and $0.92\left(1.2 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}(125$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 147.8,147.2(\mathrm{CH}(\mathrm{OMe})$ ), 143.1, 143.0, 139.2, 139.1, $137.6(3 \times$ aromatic C), 129.6, 129.5, 128.8, 128.1, 128.0, 127.2, 126.7, $126.6(9 \times$ aromatic CH), 103.8, $100.4(\mathrm{HC}=\mathrm{CH}(\mathrm{OMe})), 91.4(\mathrm{NCHN}), 59.5,56.0\left(\mathrm{OCH}_{3}\right), 55.8\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 52.9,52.7$ $\left(\mathrm{TsNCH}_{2}\right), 52.4,52.3(\mathrm{NCHCMe}), 50.5\left(\mathrm{BnNCH}_{2}\right), 48.8,48.1\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), 30.5$ $\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 25.5\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}\right), 24.7\left(\mathrm{NCHCCH}_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right) ; \mathrm{m} / z(\mathrm{FAB}+) 441$ $\left(\mathrm{MH}^{+}, 4 \%\right), 307$ (32), 154 (100); HRMS (FAB+) calcd for $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}\left(\mathrm{MH}^{+}\right)$ 441.2212, found 441.2217 .
(3RS,3aSR,6aRS)-6-Benzyl-3-(3-methoxyallyl)-3a-methyl-1-(4-toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrole 6-oxide (357) ${ }^{174}$

$m$ CPBA ( $0.025 \mathrm{~g}, 0.10 \mathrm{mmol}$ ) and $\mathrm{Li}_{2} \mathrm{CO}_{3}(0.05 \mathrm{~g}, 0.68 \mathrm{mmol})$ in DCM ( 7.5 mL ) were stirred at room temperature for 45 min and then cooled to $-78{ }^{\circ} \mathrm{C}$, and methoxy-alkene $356(0.03 \mathrm{~g}, 0.07 \mathrm{mmol})$ was added. After 2 h at $-78{ }^{\circ} \mathrm{C}, \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} .5 \mathrm{H}_{2} \mathrm{O}(0.42 \mathrm{~g}, 1.7$ mmol) was added and the mixture was stirred at $-78^{\circ} \mathrm{C}$ for 10 min before warming to room temperature. The organic phase was removed, and the remaining material was extracted from the aqueous phase with $\mathrm{DCM}(3 \times 5 \mathrm{~mL})$. The combined organic extracts
were washed with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, brine ( 5 mL ), and then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{MeOH}: \mathrm{DCM} 1: 49 \rightarrow 1: 9\right)$ afforded N oxide $357(0.31 \mathrm{~g}, 99 \%)$ as a pale yellow oil as a $3: 2 \mathrm{E}: \mathrm{Z}$ mixture; $v_{\text {max }} / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) 3412 (br), 2955 (CH), 1665, 1599, 1454, 1350, $1159\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 8.01-7.95 ( $2 \mathrm{H}, \mathrm{m}$ ), 7.64-7.58 ( $2 \mathrm{H}, \mathrm{m}$ ) and 7.40-7.30 ( $3 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}$ ), $6.18(0.6 \mathrm{H}, \mathrm{d}, J$ $12.5)$ and $5.80(0.4 \mathrm{H}, \mathrm{dt}, J 6.2,1.2, \mathrm{C} H(\mathrm{OMe})), 5.14(0.6 \mathrm{H}, \mathrm{s})$ and $5.13(0.4 \mathrm{H}, \mathrm{s}$, NCHN), $4.58(0.4 \mathrm{H}, \mathrm{d}, J 12.8)$ and $4.57(0.6 \mathrm{H}, \mathrm{d}, J 12.8, \mathrm{NCHHPh}), 4.52-4.42(1.6 \mathrm{H}$, $H_{(\text {major })} \mathrm{C}=\mathrm{CH}(\mathrm{OMe})$ and NCHHPh$)$, 4.11-4.06 $\left(0.4 \mathrm{H}, \mathrm{m}, H_{(\text {minor })} \mathrm{C}=\mathrm{CH}(\mathrm{OMe})\right)$, 3.76$3.70(1 \mathrm{H}, \mathrm{m})$ and $3.54\left(1 \mathrm{H}, \mathrm{t}, J 11.6, \mathrm{TsNCH}_{2}\right), 3.47(1.2 \mathrm{H}, \mathrm{s})$ and $3.42\left(1.8 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 3.39-2.25 $(1 \mathrm{H}, \mathrm{m})$ and 3.21-3.11 ( $1 \mathrm{H}, \mathrm{m} \mathrm{BnNCH})_{2}$, 2.65-2.56 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2} \mathrm{CHH}$ ), $2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.03-1.97(1 \mathrm{H}, \mathrm{m})$ and $1.96-1.82\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}\right), 1.56-1.47$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{TsNCH}_{2} \mathrm{CH}\right), 1.24-1.16\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2} \mathrm{CH} H\right), 0.89(1.8 \mathrm{H}, \mathrm{s})$ and $0.86(1.2 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 148.3,147.4(\mathrm{CH}(\mathrm{OMe})), 144.1,144.0,139.2$, $139.1(2 \times$ aromatic C), 132.5, 132.4 (aromatic CH), 130.8 (aromatic C), 129.9, 129.8, 129.4, 128.6, 128.1, 127.7, $127.5(8 \times$ aromatic CH$)$, 103.2, $100.0(\mathrm{HC}=\mathrm{CH}(\mathrm{OMe}))$, 97.6, $97.5(\mathrm{NCHN}), 70.2\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 62.8,62.7\left(\mathrm{BnNCH}_{2}\right), 59.5,56.1\left(\mathrm{OCH}_{3}\right)$, 55.9, $55.8\left(\mathrm{TsNCH}_{2}\right), 51.5,51.4(\mathrm{NCHCMe}), 50.2,49.4\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), 29.6,29.5$ $\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 26.3\left(\mathrm{NCHCCH}_{3}\right), 25.9,25.7\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}\right), 21.6\left(\mathrm{ArCH}_{3}\right) ; m / z(\mathrm{ESI}+)$ 479 ( $\mathrm{MNa}^{+}, 42 \%$ ), 457 ( $\mathrm{MH}^{+}, 100$ ), 429 (27), 397 (33), 155 (21); HRMS (ESI+) calcd for $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}\left(\mathrm{MH}^{+}\right) 457.2161$, found 457.2166 .

## (E)-3-((3aRS,3aSR,6aRS)-6-Benzyl-3a-methyl-1-(4-

 toluenesulfonyl)octahydropyrrolo[2,3-b]pyrrol-3-yl)propenal (3RS,3aSR,6aRS)-6-Benzyl-octahydro-3-((E)-3-methoxyallyl)-3a-methyl-1-(4-toluenesulfonyl)pyrrolo[2,3-b]pyrrole (356)

Through a solution of methoxy-alkene $356(0.033 \mathrm{~g}, 0.07 \mathrm{mmol})$ and rose bengal ( $1 \mu \mathrm{~g}$, $10 \mu \mathrm{~mol})$ in $\mathrm{MeOH}(0.9 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was slowly bubbled oxygen, while irradiating with a 500 W tungsten filament light bulb. The reaction temperature was maintained at
$-78{ }^{\circ} \mathrm{C}$ for 6 h , then DMS ( $0.11 \mathrm{~mL}, 0.15 \mathrm{mmol}$ ) was added and the reaction slowly warmed to room temperature. After 16 h , the mixture was concentrated and purified by flash chromatography ( $\mathrm{SiO}_{2}$; EtOAc:PS 1:9 $\rightarrow 1: 4$ ) to afford aldehyde $358(0.018 \mathrm{~g}$, $58 \%$ ) as a pale yellow oil; $v_{\max } / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) $2928,2820(\mathrm{CH}), 1690(\mathrm{C}=\mathrm{O}), 1456$, $1344,1157\left(\mathrm{SO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.44(1 \mathrm{H}, \mathrm{d}, J 7.7, \mathrm{CHO}), 7.76,(2 \mathrm{H}, \mathrm{d}, J 8.3,2$ $\times$ S-oCH), 7.32-7.20 (7H, m, $7 \times \mathrm{ArH}$ ), $6.55(1 \mathrm{H}, \mathrm{dd}, J 15.8,7.2, H C=C H C H O), 5.95$ ( 1 H, ddd, $J 15.8,7.7,1.3, \mathrm{CHCHO}$ ), 4.73 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{NCHN}$ ), $4.04(1 \mathrm{H}, \mathrm{d}, J 13.8)$ and 4.00 $\left(1 \mathrm{H}, \mathrm{d}, J 13.9, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.73(1 \mathrm{H}, \mathrm{dd}, J 12.2,6.9)$ and $3.31\left(1 \mathrm{H}, \mathrm{t}, J 11.9, \mathrm{TsNCH}_{2}\right)$, $2.70(1 \mathrm{H}, \mathrm{ddd}, J 9.1,7.4,4.7)$ and $2.66-2.59\left(1 \mathrm{H}, \mathrm{m}, \mathrm{BnNCH}_{2}\right), 2.43\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right)$, 2.15-2.08 ( $\left.1 \mathrm{H}, \mathrm{m}, \mathrm{TsNCH}_{2} \mathrm{CH}\right), 1.75\left(1 \mathrm{H}, \mathrm{dt}, J 12.7,7.3, \mathrm{BnNCH}_{2} \mathrm{CHH}\right), 1.27(1 \mathrm{H}$, ddd, J 12.6, 6.7, 4.8, $\mathrm{BnNCH}_{2} \mathrm{CHH}$ ), $1.01\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $192.9(\mathrm{C}=\mathrm{O}), 152.0(\mathrm{HC=CHCHO}), 143.7,138.8,137.0(3 \times$ aromatic C$), 129.8,128.7$, 128.2, 127.2, $126.9(9 \times$ aromatic CH$), 134.8(\mathrm{HC}=\mathrm{CHCHO}), 90.6(\mathrm{NCHN}), 55.4$ $\left(\mathrm{NCH}_{2} \mathrm{Ph}\right), 53.5(\mathrm{NCHCMe}), 51.5\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), 51.1\left(\mathrm{TsNCH}_{2}\right), 50.2\left(\mathrm{BnNCH}_{2}\right), 31.4$ $\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 24.8\left(\mathrm{NCHCCH}_{3}\right), 21.6\left(\mathrm{ArCH}_{3}\right) ; m / z(\mathrm{ESI}+) 447\left(\mathrm{MNa}^{+}, 100 \%\right), 417$ (16); HRMS (ESI+) calcd for $\mathrm{C}_{24} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{SNa}\left(\mathrm{MNa}^{+}\right)$447.1718, found 447.1722.

Olefin starting material $\mathbf{3 5 6}(0.014 \mathrm{~g}, 41 \%)$ in a $>10: 1 \mathrm{E}: Z$ ratio as a pale yellow oil; $v_{\text {max }} / \mathrm{cm}^{-1}\left(\mathrm{CHCl}_{3}\right.$ cast) $2930(\mathrm{CH}), 1720,1660,1597,1454,1344,1157\left(\mathrm{SO}_{2}\right)$; peaks corresponding to $E$ alkene are quoted: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.74,(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{S}-$ $o \mathrm{CH})$, 7.33-7.18 ( $7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}$ ), $6.17(1 \mathrm{H}, \mathrm{d}, J 12.5, \mathrm{CH}(\mathrm{OMe})), 4.62(1 \mathrm{H}, \mathrm{s}$, NCHN), 4.45 ( 1 H , ddd, $J 12.6,8.0,6.9, H \mathrm{C}=\mathrm{CH}(\mathrm{OMe})$ ), $4.09(1 \mathrm{H}, \mathrm{d}, J 13.9)$ and 3.97 $\left(1 \mathrm{H}, \mathrm{d}, J 13.8, \mathrm{NCH}_{2} \mathrm{Ph}\right), 3.66(1 \mathrm{H}, \mathrm{dd}, J 12.1,6.9, \mathrm{TsNCHH}), 3.46\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.92$ $(1 \mathrm{H}, \mathrm{t}, J 12.1, \mathrm{TsNCH} H), 2.69(1 \mathrm{H}, \mathrm{ddd}, J 9.0,7.5,4.1)$ and $2.59(1 \mathrm{H}, \operatorname{ddd}, J 9.0,8.2$, $\left.6.5, \mathrm{BnNCH}_{2}\right), 2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.93-1.86(1 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HCH}=\mathrm{CH}), 1.77(1 \mathrm{H}, \mathrm{dt}, J$ 12.6, 7.7, $\left.\mathrm{BnNCH}_{2} \mathrm{CHH}\right)$, 1.71-1.63 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}=\mathrm{CH}$ ), $1.25-1.16(2 \mathrm{H}, \mathrm{m}$, TsNCH ${ }_{2} \mathrm{CH}$ and $\mathrm{BnNCH}_{2} \mathrm{CHH}$ ), $0.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCHCCH}_{3}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 147.8$ $(\mathrm{CH}(\mathrm{OMe})), 143.1,139.1,137.6(3 \times$ aromatic C$), 129.6,128.8,128.1,127.2,126.7$ ( 9 $\times$ aromatic CH$), 100.4(\mathrm{HC}=\mathrm{CH}(\mathrm{OMe}))$, $91.4(\mathrm{NCHN}), 56.0\left(\mathrm{OCH}_{3}\right), 55.8\left(\mathrm{NCH}_{2} \mathrm{Ph}\right)$, $52.8\left(\mathrm{TsNCH}_{2}\right), 52.3(\mathrm{NCHCMe}), 50.5\left(\mathrm{BnNCH}_{2}\right), 48.8\left(\mathrm{TsNCH}_{2} \mathrm{CH}\right), 30.5$ $\left(\mathrm{BnNCH}_{2} \mathrm{CH}_{2}\right), 25.5\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}\right), 24.7\left(\mathrm{NCHCCH}_{3}\right), 21.5\left(\mathrm{ArCH}_{3}\right) ; \mathrm{m} / \mathrm{z}$ (ESI+) 463 $\left(\mathrm{MNa}^{+}, 100 \%\right)$, $441\left(\mathrm{MH}^{+}, 95\right)$; HRMS (ESI+) calcd for $\mathrm{C}_{25} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{SNa}\left(\mathrm{MNa}^{+}\right)$ 463.2031, found 463.2034.

### 6.2. Synthesis of 3-amino-2-silyloxyacrylates

Ethyl diazo(triethylsilyl)acetate (359) ${ }^{175}$

$$
\prod_{\mathrm{N}_{2}}^{\mathrm{CO}_{2} \mathrm{Et}} \xrightarrow[\substack{\mathrm{Et}_{2} \mathrm{O},-78{ }^{\circ} \mathrm{C} \\(89 \%)}]{\text { TESOTf, DIPEA }} \prod_{\mathrm{N}_{2}}^{\mathrm{Et}_{3} \mathrm{Si}} \prod_{2}^{\mathrm{NO}_{2} \mathrm{Et}}
$$

A stirring solution of ethyl diazoacetate ( $4.0 \mathrm{~mL}, 38 \mathrm{mmol}$ ) and ethyldiisopropylamine $(6.6 \mathrm{~mL}, 38 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(170 \mathrm{~mL})$ was cooled to $-78{ }^{\circ} \mathrm{C}$. Triethylsilyl trifluoromethanesulfonate ( $8.6 \mathrm{~mL}, 38 \mathrm{mmol}$ ) was added dropwise and the resulting suspension stirred at $-78{ }^{\circ} \mathrm{C}$ for 30 min , then at room temperature for 17 h . Filtration, concentration and purification by flash chromatography ( $\mathrm{SiO}_{2}$; PS $\rightarrow$ EtOAc:PS 1:49) provided silylated product $\mathbf{3 5 9}{ }^{149}\left(7.7 \mathrm{~g}, 89 \%\right.$ ) as a yellow liquid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $4.17\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right), 1.26\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.97(9 \mathrm{H}, \mathrm{t}, J 7.8$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.72\left(6 \mathrm{H}, \mathrm{q}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 169.7(\mathrm{O}=\mathrm{C}), 85.9$ $\left(\mathrm{C}=\mathrm{N}_{2}\right), 60.6\left(\mathrm{CO}_{2} \mathrm{CH}_{2}\right), 14.4\left(\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 7.0\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right)$, $3.2\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right)$.

## Typical procedure for preparation of formamides:

## 1-Formylpyrrolidine (369a)

A stirring mixture of pyrrolidine ( $1.0 \mathrm{~mL}, 12 \mathrm{mmol}$ ) and ethyl formate $(10.0 \mathrm{~mL}, 124$ mmol ) were heated at reflux for 16 h . Excess ethyl formate and ethanol were removed in vacuo to afford 1-formylpyrrolidine $\mathbf{3 6 9 a}(1.25 \mathrm{~g}, 95 \%)$ as a brown oil; $\delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.22(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 3.48-3.44(2 \mathrm{H}, \mathrm{m})$ and 3.43-3.39 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right)$, 1.91$1.87\left(4 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.1(\mathrm{CHO}), 46.0,43.1\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2}\right)$, 24.9, $24.2\left(\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right)$.

## 1-Formylpiperidine (369b)

Piperidine ( $0.56 \mathrm{~mL}, 5.6 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9 b}{ }^{176}(0.60 \mathrm{~g}, 95 \%)$ as a pale brown oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.90(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 3.39-3.35$ $(2 \mathrm{H}, \mathrm{m})$ and 3.23-3.19 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right), 1.62-1.50(2 \mathrm{H}, \mathrm{m})$ and 1.49-1.39

$\left(4 \mathrm{H}, \mathrm{m}\right.$, and $\left.\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.8(\mathrm{CHO}), 46.8,40.5\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)-\right.$ 2), 26.5, $25.0\left(\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right), 24.6\left(\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$.

## 4-Formylmorpholine (369c)

Morpholine ( $0.56 \mathrm{~mL}, 6.3 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9}{ }^{176}(0.66 \mathrm{~g}, 91 \%)$ as a colourless oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.04(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 3.71-3.66(4 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{O}\left(\mathrm{CH}_{2}\right)_{2}\right), 3.59-3.56(2 \mathrm{H}, \mathrm{m})$ and 3.41-3.38 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right) ; \delta_{\mathrm{C}}(75$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.9(\mathrm{CHO}), 67.2,66.4\left(\mathrm{O}\left(\mathrm{CH}_{2}\right)_{2}\right), 45.8,40.6\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2}\right)$.

## 8-Formyl-1,4-dioxa-8-azaspiro[4.5]decane (369d)

1,4-Dioxa-8-azaspiro[4.5]decane ( $0.50 \mathrm{~g}, 3.5 \mathrm{mmol}$ ) provided formamide 369d ( $0.60 \mathrm{~g}, 99 \%$ ) as a pale brown oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) $2880(\mathrm{CH}), 1674$ $(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.03(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 3.98\left(4 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right)$, 3.64-3.60 $(2 \mathrm{H}, \mathrm{m})$ and 3.47-3.43 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right), 1.74-1.66(4 \mathrm{H}, \mathrm{m}$, $\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2} ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.8(\mathrm{CHO}), 107.2\left(\mathrm{C}\left(\mathrm{OCH}_{2}\right)_{2}\right), 64.6$
 $\left(\mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right), 43.8,37.5\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2}\right), 35.7,34.3\left(\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right) ; m / z(\mathrm{CI}+) 172\left(\mathrm{MH}^{+}\right.$, $100 \%$ ), 121 (28); HMRS (CI+) calcd for $\mathrm{C}_{8} \mathrm{H}_{14} \mathrm{NO}_{3}\left(\mathrm{MH}^{+}\right)$172.0974, found 172.0980.

## 1-Formyl-4-methyl-piperazine (369e)

1-Methylpiperazine ( $0.50 \mathrm{~mL}, 4.5 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9}^{177}(0.53$ $\mathrm{g}, 93 \%)$ as a pale brown oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.08(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 3.55-$ $3.52(2 \mathrm{H}, \mathrm{m})$ and $3.38-3.35\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.40-2.33(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{MeN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.29\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.7(\mathrm{CHO}), 55.3$, $54.2\left(\mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 46.1,45.4\left(\mathrm{MeN}\left(\mathrm{CH}_{2}\right)_{2}\right), 39.8\left(\mathrm{CH}_{3}\right)$.

## 1-Benzhydryl-4-formylpiperazine (369f)

1-Benzhydrylpiperazine ( $0.50 \mathrm{~g}, 2.0 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9 f}$ ( 0.55 $\mathrm{g}, 99 \%$ ) as a pink solid; m.p. $=106-107{ }^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2953(\mathrm{CH})$, 1688,$1632 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.99(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.43-7.40(4 \mathrm{H}, \mathrm{m})$, 7.31-7.26 $(4 \mathrm{H}, \mathrm{m})$ and $7.23-7.17(2 \mathrm{H}, \mathrm{m}, 10 \times \mathrm{ArH}), 4.27(1 \mathrm{H}, \mathrm{s}$,

$\left.\mathrm{NCHPh}_{2}\right), 3.57-3.54(2 \mathrm{H}, \mathrm{m})$ and 3.37-3.34 (2H, m, $\left.\mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.41-2.36(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{Ph}_{2} \mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.8(\mathrm{CHO}), 142.0$ ( 2 x aromatic C), 128.7, 127.8, $127.3(10 \times$ aromatic CH$), 75.9\left(\mathrm{NCHPh}_{2}\right), 52.3,51.1\left(\mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 45.9,40.2$ $\left(\mathrm{Ph}_{2} \mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right) ; m / z(\mathrm{CI}+) 281\left(\mathrm{MH}^{+}, 12 \%\right), 280(23), 167$ (100); HRMS (CI+) calcd for $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{MH}^{+}\right)$281.1654, found 281.1647; Elemental analysis: calcd for $\mathrm{C}_{18} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}$ C: 77.1, H: 7.2, N: 10.0. Found C: 77.2, H: 7.3, N: 9.9.

## 1-(3-Chlorophenyl)-4-formylpiperazine (369g)

1-(3-Chlorophenyl)piperazine ( $0.50 \mathrm{~g}, 2.5 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9 g}(0.57 \mathrm{~g}, 99 \%)$ as a pale brown oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2829 (CH), 1649 $(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.10(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.22-7.16(1 \mathrm{H}, \mathrm{m})$, 6.89-6.86 $(2 \mathrm{H}, \mathrm{m})$ and $6.81-6.78(1 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{ArH})$, $3.71-3.68(2 \mathrm{H}, \mathrm{m})$ and 3.54-3.51 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 3.21-3.11\left(4 \mathrm{H}, \mathrm{m}, \operatorname{ArN}\left(\mathrm{CH}_{2}\right)_{2}\right) ; \delta_{\mathrm{C}}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 160.8 ( CHO ), $152.0(\mathrm{NC}=\mathrm{C})$, 135.1 (CCl), 130.2,
 120.6, 116.9, 115.0 $(4 \times$ aromatic CH$), 50.0,49.0\left(\mathrm{OHCN}\left(\mathrm{CH}_{2}\right)_{2}\right), 45.4,39.8$ $\left(\operatorname{ArN}\left(\mathrm{CH}_{2}\right)_{2}\right) ; m / z(\mathrm{CI}+) 225\left(\mathrm{MH}^{+}, 100 \%\right), 197(44), 166$ (31); HRMS (CI+) calcd for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{ClN}_{2} \mathrm{O}\left(\mathrm{MH}^{+}\right)$225.0795, found 225.0796.

## $N$-Allyl- $N$-benzylformamide (369i)

Benzyl bromide ( $2.00 \mathrm{~g}, 11.7 \mathrm{mmol}$ ) was added dropwise to allylamine ( $4.01 \mathrm{~g}, 70.2$ $\mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$. Stirring was maintained at this temperature for 30 min then for 16 h at room temperature before it was quenched with saturated $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$. The product was extracted with ether ( $3 \times 10 \mathrm{~mL}$ ), washed with brine $(3 \times 10 \mathrm{~mL})$ then dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2}\right.$; $\mathrm{EtOAc}: \mathrm{PS}$ $1: 9 \rightarrow 3: 7$ ) provided $N$-benzylallylamine ${ }^{154}(1.37 \mathrm{~g}, 80 \%)$ as a colourless oil; $\delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.34-7.25(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.99-5.90\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.22-5.10(2 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 3.80\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2}\right), 3.29\left(2 \mathrm{H}, \mathrm{d}, J 6.0, \mathrm{H}_{2} \mathrm{C}=\mathrm{CHCH}_{2}\right), 1.48(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{NH}) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 140.3$ (aromatic C), $136.8\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 128.4,128.2$, 127.0 (5 $\times$ aromatic CH$), 116.0\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right)$, $53.3\left(\mathrm{PhCH}_{2}\right), 51.8\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CHCH}_{2}\right)$.
 pale brown oil; ratio of rotamers $1: 1$ in $\mathrm{CDCl}_{3}$ at room temperature; $\delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.32,8.22(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.36-7.18(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.78-5.60(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right)$, 5.27-5.08 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}$ ), 4.52, $4.37\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2}\right), 3.84,3.72(2 \mathrm{H}, \mathrm{d}, J$ $\left.5.9, \mathrm{H}_{2} \mathrm{C}=\mathrm{CHCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 162.9,162.6(\mathrm{CHO}), 136.2,135.9$ (aromatic C), 132.9, $131.9\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 128.9,128.7,128.4,128.1,127.6(5 \times$ aromatic CH$)$, 118.9, $118.4\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right)$, 50.5, $49.1\left(\mathrm{PhCH}_{2}\right) 45.0,44.0\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CHCH}_{2}\right)$.

## $N, N$-Diallylformamide (369j)

Diallylamine ( $0.50 \mathrm{~g}, 5.2 \mathrm{mmol}$ ) afforded formamide $\mathbf{3 6 9} \mathbf{j}^{179}(0.57$ $\mathrm{g}, 88 \%)$ as a pale brown oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.11(1 \mathrm{H}, \mathrm{s}$, CHO ), 5.79-5.63 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}$ ), $5.25-5.18(4 \mathrm{H}, \mathrm{m}, 2 \times$
 $\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 3.92(2 \mathrm{H}, \mathrm{d}, J 5.7)$ and $3.80\left(2 \mathrm{H}, \mathrm{d}, J 5.7,2 \times \mathrm{NCH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 162.6 (CHO), 133.1, $132.1\left(2 \times \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 118.6,118.1\left(2 \times \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 49.3,44.3(2 \times$ $\mathrm{NCH}_{2}$ ).

## $N$-Formylsarcosine ethyl ester (369k)

1 M NaOH was added to a stirring suspension of sarcosine ethyl ester hydrochloride $(2.00 \mathrm{~g}, 13.0 \mathrm{mmol})$ in EtOAc ( 10 mL ) until the solids were dissolved. The organic layer was separated, washed with brine $(3 \times 10 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Concentration afforded the free amine ${ }^{180}(0.52 \mathrm{~g}, 34 \%)$ as a colourless oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.18$ $\left(2 \mathrm{H}, \mathrm{q}, J 7.2, \mathrm{OCH}_{2}\right), 3.35\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{2}\right), 2.43\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 1.60(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 1.27$ $\left(3 \mathrm{H}, \mathrm{t}, J 7.2, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.4(\mathrm{C}=\mathrm{O}), 60.7\left(\mathrm{OCH}_{2}\right), 52.7$ $\left(\mathrm{NCH}_{2}\right), 36.2\left(\mathrm{NCH}_{3}\right), 14.3\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$.

Sarcosine ethyl ester $(0.48 \mathrm{~g}, 4.10 \mathrm{mmol})$ afforded formamide $\mathbf{3 6 9} \mathbf{k}^{181}(0.59 \mathrm{~g}, 100 \%)$ as a colourless oil; ratio of rotamers in $\mathrm{CDCl}_{3}$ at room temperature $2: 1 ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.08,8.01(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 4.23-4.14\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right), 4.05,3.95\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{2}\right)$,
3.01, $2.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 1.29-1.22\left(3 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 168.7$, $168.3(\mathrm{C}=\mathrm{O}), 163.2,163.0(\mathrm{CHO}), 61.7,61.4\left(\mathrm{OCH}_{2}\right), 50.9,45.6\left(\mathrm{NCH}_{2}\right), 35.3,30.8$ $\left(\mathrm{NCH}_{3}\right), 14.1\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$.

## $N$-Benzylformanilide (3691)

$N$-Benzylaniline ( $0.50 \mathrm{~g}, 2.7 \mathrm{mmol}$ ) was heated to reflux in ethyl formate ( $5.0 \mathrm{~mL}, 62 \mathrm{mmol}$ ) for 8 d . Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{EtOAc}: \mathrm{PS} 1: 4\right)$ provided formanilide
 $3691^{182}(0.46 \mathrm{~g}, 80 \%)$ as a pale yellow solid; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.58(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO})$, 7.36-7.24 and 7.11-7.08 $(10 \mathrm{H}, \mathrm{m}, 10 \times \mathrm{ArH}), 4.87\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 162.4 (CHO), 141.0, 136.7 ( 2 x aromatic C), 129.6, 128.6, 127.9, 127.5, 126.9, 124.1 $(10 \times$ aromatic CH$), 48.9\left(\mathrm{CH}_{2}\right)$.

## $N$-Benzyl- $N$-(but-3-enyl)formamide (369m)

To a stirring solution of 4-bromo-1-butene ( $1.00 \mathrm{~g}, 7.4 \mathrm{mmol}$ ) in EtOH ( 10 mL ) was added $\mathrm{NH}_{2} \mathrm{Bn}(4.0 \mathrm{~mL}, 37 \mathrm{mmol})$ dropwise, followed by $\mathrm{NaI}(0.04 \mathrm{~g}, 0.27 \mathrm{mmol})$. The resulting mixture was heated at reflux for 4 h , and the solvent removed in vacuo. The product was diluted with $\mathrm{DCM}(100 \mathrm{~mL})$ and washed with $1 \mathrm{M} \mathrm{KOH}(100 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}$ (2 $\times 100 \mathrm{~mL})$, brine $(2 \times 100 \mathrm{~mL})$ and dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$. Concentration and purification by flash chromatography $\left(\mathrm{SiO}_{2} ; \mathrm{MeOH}: \mathrm{DCM} 1: 19 \rightarrow 1: 9\right)$ afforded $N$-benzyl-3-buten-1ylamine ${ }^{183}(1.05 \mathrm{~g}, 88 \%)$ as a pale brown oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.36-7.24(5 \mathrm{H}, \mathrm{m}, 5$ $\times \mathrm{ArH}), 5.83-5.74\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.13-5.05\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 3.80(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 2.71\left(2 \mathrm{H}, \mathrm{t}, J 6.8, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 2.34-2.24\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 1.50(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{NH}) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 140.4$ (aromatic C), $136.5\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 128.4,128.1,127.0$ (5 $\times$ aromatic CH$), 116.4\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 53.9\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 48.3\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 34.3\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right)$.
$N$-Benzyl-3-buten-1-ylamine $(0.50 \mathrm{~g}, 3.1 \mathrm{mmol})$ afforded formamide $\mathbf{3 6 9} \mathbf{m}^{184}(0.58 \mathrm{~g}$, $99 \%$ ) as a brown oil; ratio of rotamers $1: 1$ in $\mathrm{CDCl}_{3}$ at room temperature; $\delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.27,8.18(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.37-7.21(5 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{ArH}), 5.86-5.60(1 \mathrm{H}, \mathrm{m}$,
$\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.10-5.01\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 4.54,4.39\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 3.33-3.28,3.23-3.18$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}$ ), 2.28-2.21 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}$ ); $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 163.0,162.9$ (CHO), 136.4, 136.1 (aromatic C), 135.0, $133.9\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 128.9,128.7$, 128.2, 128.1, 127.6, $127.5(5 \times$ aromatic CH$), 118.1,117.0\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 51.5,41.4\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 46.4,45.4$ $\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 32.7,31.5\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right)$.

## Typical procedure for preparation of vinylogous carbamates:

Ethyl (Z)-3-(pyrrolidin-1-yl)-2-(triethylsilyloxy)acrylate (370a)

Ethyl diazo(triethylsilyl)acetate ( $0.29 \mathrm{~g}, 1.3 \mathrm{mmol}$ ) in benzene ( 3 mL ) was added to a refluxing solution of 1-formylpyrrolidine ( $0.10 \mathrm{~g}, 1.0 \mathrm{mmol}$ ) and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}(2 \mathrm{mg}, 4.0$ $\mu \mathrm{mol})$ in benzene ( 3 mL ). After 90 min the reaction mixture was concentrated in vacuo and purified by flash chromatography $\left(\mathrm{Al}_{2} \mathrm{O}_{3} ; \mathrm{PS} \rightarrow \mathrm{EtOAc}: \mathrm{PS} 3: 97\right)$ to afford acrylate 370a $(0.24 \mathrm{~g}, 80 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2953, $2876(\mathrm{CH}), 1693,1639$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.86(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.13\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right), 3.48-3.43(4 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right), 1.84-1.80\left(4 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right), 1.26\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.96(9 \mathrm{H}$, $\left.\mathrm{t}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.71\left(6 \mathrm{H}, \mathrm{q}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 167.2$ $(\mathrm{O}=\mathrm{C}), 131.7(\mathrm{NCH}=\mathrm{C}), 117.8(\mathrm{NCH}=\mathrm{C}), 59.5\left(\mathrm{OCH}_{2}\right), 50.6\left(\mathrm{~N}_{\left.\left(\mathrm{CH}_{2}\right)_{2}\right),}, 25.4\right.$ $\left(\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right), 14.6\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 7.0\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; ~ m / z(\mathrm{CI}+) 300$ $\left(\mathrm{MH}^{+}, 36 \%\right), 270$ (100); HRMS (CI+) calcd for $\mathrm{C}_{15} \mathrm{H}_{30} \mathrm{NO}_{3} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 300.1995$, found 300.1984; Elemental analysis: calcd for $\mathrm{C}_{15} \mathrm{H}_{29} \mathrm{NO}_{3} \mathrm{Si} \mathrm{C}: 60.2, \mathrm{H}: 9.8, \mathrm{~N}: 4.7$. Found C: 60.0, H: 9.9, N: 5.0.

## Ethyl (Z)-3-(piperidin-1-yl)-2-(triethylsilyloxy)acrylate (370b)

Formamide 369b ( $0.10 \mathrm{~g}, 0.88 \mathrm{mmol}$ ) afforded acrylate $\mathbf{3 7 0 b}(0.23 \mathrm{~g}$, $83 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2937, 2876 (CH), 1693, $1639 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.61(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.14(2 \mathrm{H}, \mathrm{q}, J 7.1$, $\left.\mathrm{OCH}_{2}\right), \quad 3.41-3.40\left(4 \mathrm{H}, \quad \mathrm{m}, \quad \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right), \quad 1.62-1.58 \quad(6 \mathrm{H}, \quad \mathrm{m}$, $\left(\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right), 1.25\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.97(9 \mathrm{H}, \mathrm{t}, J 7.8$,

$\left.\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.71\left(6 \mathrm{H}, \mathrm{q}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 167.4(\mathrm{O}=\mathrm{C})$, $133.3(\mathrm{NCH}=C), 117.3(\mathrm{NCH}=\mathrm{C}), 59.7\left(\mathrm{OCH}_{2}\right), 51.1\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2}\right), 26.2\left(\mathrm{~N}^{2}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right)$, $24.4\left(\mathrm{~N}_{\left.\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right)} 14.6\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 6.9\left(\mathrm{Si}^{\left.\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z . z . ~}\right.\right.$ (CI+) 314 ( $\mathrm{MH}^{+}, 84 \%$ ), 284 (100), 268 (50), 256 (27); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{NO}_{3} \mathrm{Si}\left(\mathrm{MH}^{+}\right)$314.2151, found 314.2137; Elemental analysis: calcd for $\mathrm{C}_{16} \mathrm{H}_{31} \mathrm{NO}_{3} \mathrm{Si} \mathrm{C}: 61.3, \mathrm{H}: 10.0, \mathrm{~N}: 4.5$. Found C: 61.2, H: 10.2, N: 4.1.

## Ethyl (Z)-3-(morpholin-4-yl)-2-(triethylsilyloxy)acrylate (370c)

Formamide 369c ( $0.10 \mathrm{~g}, 0.87 \mathrm{mmol}$ ) afforded acrylate 370c $(0.24 \mathrm{~g}$, $87 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2957, $2876(\mathrm{CH}), 1699$, 1643 ; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.54(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.15(2 \mathrm{H}, \mathrm{q}, J 7.1$, $\left.\mathrm{CO}_{2} \mathrm{CH}_{2}\right)$, 3.69-3.66 (4H, m, O(CH2 $)_{2}$ ), $3.43-3.40\left(4 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right)$, $1.27\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.96\left(9 \mathrm{H}, \mathrm{t}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.71$
 ( $\left.6 \mathrm{H}, \mathrm{q}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 166.9(\mathrm{O}=\mathrm{C}), 132.2(\mathrm{NCH}=C), 119.6$ $(\mathrm{NCH}=\mathrm{C}), 66.8\left(\mathrm{O}\left(\mathrm{CH}_{2}\right)_{2}\right), 60.0\left(\mathrm{CO}_{2} \mathrm{CH}_{2}\right), 50.2\left(\mathrm{~N}_{\left.\left(\mathrm{CH}_{2}\right)_{2}\right), 14.6\left(\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 6.9}\right.$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z(\mathrm{CI}+) 316\left(\mathrm{MH}^{+}, 86 \%\right), 286$ (100), 88 (25); HRMS (CI+) calcd for $\mathrm{C}_{15} \mathrm{H}_{30} \mathrm{NO}_{4} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 316.1944$, found 316.1940.

## Ethyl (Z)-3-(1,4-dioxa-8-azaspiro[4.5]dec-8-yl)-2-(triethylsilyloxy)acrylate (370d)

Formamide 369d ( $0.10 \mathrm{~g}, 0.58 \mathrm{mmol}$ ) provided acrylate $370 \mathrm{~d}(0.20 \mathrm{~g}$, $90 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2953, $2876(\mathrm{CH}), 1693$, 1639 ; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.60(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.14(2 \mathrm{H}, \mathrm{q}, J 7.1$, $\mathrm{CO}_{2} \mathrm{CH}_{2}$ ), $3.97\left(4 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right), 3.54-3.50\left(4 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right)$, 1.72-1.69 (4H, m, N(CH2 CH $)_{2}$ ), $1.25\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.96$ (9H, t, J 7.9, $\left.\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.70\left(6 \mathrm{H}, \mathrm{q}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}(75$

## Ethyl (Z)-3-(4-methylpiperazin-1-yl)-2-(triethylsilyloxy)acrylate (370e)

Ethyl diazo(triethylsilyl)acetate $(0.22 \mathrm{~g}, 0.96 \mathrm{mmol})$ in benzene ( 3 mL ) was added to a refluxing solution of 1 -formyl-4-methylpiperazine $(0.10 \mathrm{~g}, 0.78 \mathrm{mmol})$ and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}(1.3 \mathrm{mg}, 3.1 \mu \mathrm{~mol})$ in benzene ( 3 mL ). After 6 d , an extra portion of ethyl diazo(triethylsilyl)acetate ( $0.22 \mathrm{~g}, 0.96 \mathrm{mmol}$ ) in benzene ( 3 mL ) and
 $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}(1.3 \mathrm{mg}, 3.1 \mu \mathrm{~mol})$ was added to the reaction mixture.
After a total reaction time of 10 d , the reaction mixture was concentrated and purified by flash chromatography $\left(\mathrm{Al}_{2} \mathrm{O}_{3} ; \mathrm{DCM} \rightarrow \mathrm{MeOH}: \mathrm{DCM} 1: 9\right)$ to afford acrylate $\mathbf{3 7 0 e}$ $(0.16 \mathrm{~g}, 63 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2953, $2876(\mathrm{CH}), 1693,1643 ; \delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.57(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.13\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right), 3.45(4 \mathrm{H}, \mathrm{t}, J 5.0$, $\left.\mathrm{C}=\mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.39\left(4 \mathrm{H}, \mathrm{t}, J 5.0, \mathrm{MeN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.28\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 1.26(3 \mathrm{H}, \mathrm{t}, J 7.1$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.96\left(9 \mathrm{H}, \mathrm{t}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.70\left(6 \mathrm{H}, \mathrm{q}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}(75$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 167.1(\mathrm{O}=\mathrm{C}), 132.4(\mathrm{NCH}=\mathrm{C}), 118.7(\mathrm{NCH}=\mathrm{C}), 59.9\left(\mathrm{OCH}_{2}\right), 55.0$ $\left(\mathrm{MeN}\left(\mathrm{CH}_{2}\right)_{2}\right), \quad 50.6 \quad\left(\mathrm{C}=\mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right), \quad 46.2 \quad\left(\mathrm{NCH}_{3}\right), \quad 14.6 \quad\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), \quad 6.9$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z(\mathrm{CI}+) 329\left(\mathrm{MH}^{+}, 100 \%\right), 299$ (100), 283 (34), 103 (24); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 329.2260$, found 329.2249 .

## Ethyl (Z)-3-(4-benzhydrylpiperazin-1-yl)-2-(triethylsilyloxy)acrylate (370f)

Formamide $369 \mathrm{f}(0.60 \mathrm{~g}, 2.1 \mathrm{mmol})$ afforded acrylate $\mathbf{3 7 0 f}(0.90 \mathrm{~g}$, $87 \%$ ) as a white solid; m.p. $=64-66^{\circ} \mathrm{C} ; v_{\max } / \mathrm{cm}^{-1}(\mathrm{KBr}) 2953(\mathrm{CH})$, 1688,$1632 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.41(4 \mathrm{H}, \mathrm{d}, J 7.1), 7.30-7.26(4 \mathrm{H}$, $\mathrm{m})$ and 7.21-7.16 $(2 \mathrm{H}, \mathrm{m}, 10 \times \mathrm{ArH}), 6.57(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 4.22$ $\left(1 \mathrm{H}, \mathrm{s}, \mathrm{NCHPh}_{2}\right), 4.14\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right), 3.46-3.43(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{C}=\mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right), 2.40-2.37\left(4 \mathrm{H}, \mathrm{m}, \mathrm{Ph}_{2} \mathrm{CHN}\left(\mathrm{CH}_{2}\right)_{2}\right), 1.26(3 \mathrm{H}, \mathrm{t}, J$

 $\left.\mathrm{OCH}_{2}\right), 3.00\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 1.29-1.23\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.95(9 \mathrm{H}, \mathrm{t}, J 7.9$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.70\left(6 \mathrm{H}, \mathrm{q}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 169.8$ $\left(\mathrm{NCH}_{2} \mathrm{C}=\mathrm{O}\right), 166.9(\mathrm{NCH}=\mathrm{CC}=\mathrm{O}), 132.5(\mathrm{NCH}=C), 119.2(\mathrm{NCH}=\mathrm{C}), 61.0,60.0(2 \times$ $\left.\mathrm{OCH}_{2}\right) 54.4\left(\mathrm{NCH}_{2}\right), 42.1\left(\mathrm{NCH}_{3}\right), 14.6,14.2\left(2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) 6.9\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z(\mathrm{CI}+) 346\left(\mathrm{MH}^{+}, 49 \%\right), 316$ (100), 300 (15), 121 (25); HRMS (CI+) calcd for $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{NO}_{5} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 346.2050$, found 346.2032; Elemental analysis: calcd for $\mathrm{C}_{16} \mathrm{H}_{31} \mathrm{NO}_{5} \mathrm{Si} \mathrm{C}: 55.7, \mathrm{H}: 9.0, \mathrm{~N}: 4.1$. Found C: 55.8, H: 9.2, N: 4.1.

## Ethyl (Z)-3-( $N$-benzyl- $N$-phenylamino)-2-(triethylsilyloxy)acrylate (3701)

Ethyl diazo(triethylsilyl)acetate ( $0.15 \mathrm{~g}, 0.59 \mathrm{mmol}$ ) in benzene (3 mL ) was added to a refluxing solution of $N$-benzylformanilide $(0.10 \mathrm{~g}, 0.47 \mathrm{mmol})$ and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}(0.9 \mathrm{mg}, 1.9 \mu \mathrm{~mol})$ in benzene $(3 \mathrm{~mL})$. After 3 h , the reaction mixture was concentrated in vacuo
 to provide a 3:2 mixture of $Z: E$ geometric isomers. Purification by flash chromatography $\left(\mathrm{Al}_{2} \mathrm{O}_{3} ; \mathrm{PS}\right)$ afforded pure Z-isomer $3701(0.05 \mathrm{~g}, 28 \%)$ and a mixture of $Z$ : $E$-isomers (total yield $0.09 \mathrm{~g}, 50 \%$ ) as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2953, 2876 $(\mathrm{CH}), 1703,1643 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.33-7.20(8 \mathrm{H}, \mathrm{m})$ and 6.98-6.93 $(3 \mathrm{H}, \mathrm{m}, 10 \times$ ArH and $\mathrm{NCH}=\mathrm{C}), 5.18\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{2}\right), 4.22\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right), 1.32(3 \mathrm{H}, \mathrm{t}, J 7.1$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.87\left(9 \mathrm{H}, \mathrm{t}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.60\left(6 \mathrm{H}, \mathrm{q}, J 7.9, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}(75$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 166.5(\mathrm{O}=\mathrm{C}), 146.3(\mathrm{NCH}=C), 138.6$ (aromatic C), 128.9, 128.6, $(4 \times$ aromatic CH ), 126.9 (aromatic C), 126.3, 126.2, $125.2(4 \times \operatorname{aromatic} \mathrm{CH}), 121.7$ $(\mathrm{NCH}=\mathrm{C}), 118.0(2 \times \operatorname{aromatic} \mathrm{CH}), 60.5\left(\mathrm{OCH}_{2}\right), 52.9\left(\mathrm{NCH}_{2}\right), 14.5\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 6.8$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.3\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z(\mathrm{CI}+) 412\left(\mathrm{MH}^{+}, 67 \%\right), 382$ (100), 91 (39); HRMS (CI+) calcd for $\mathrm{C}_{34} \mathrm{H}_{34} \mathrm{NO}_{3} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 412.2308$, found 412.2309.

## Ethyl (Z)-3-( $N$-benzyl- $N$-but-3-enylamino)-2-(triethylsilyloxy)acrylate (370m)

$N$-Benzyl- $N$-(but-3-enyl)formamide $(0.10 \mathrm{~g}, 0.53 \mathrm{mmol})$ afforded acrylate $370 \mathrm{~m}(0.17 \mathrm{~g}, 83 \%)$ as a colourless oil; $v_{\max } / \mathrm{cm}^{-1}$ (film) 2952, $2875(\mathrm{CH}), 1694,1634 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.35-7.24(5 \mathrm{H}$, $\mathrm{m}, 5 \times \mathrm{ArH}), 6.78(1 \mathrm{H}, \mathrm{s}, \mathrm{NCH}=\mathrm{C}), 5.73(1 \mathrm{H}$, ddt, $J 17.1,10.2,6.9$,
 $\left.\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 5.08-5.01\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 4.56\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.16(2 \mathrm{H}, \mathrm{q}, J 7.1$, $\left.\mathrm{OCH}_{2}\right), 3.24\left(2 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 2.28\left(2 \mathrm{H}, \mathrm{q}, J 7.2, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 1.28(3 \mathrm{H}, \mathrm{t}, J 7.1$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 0.93\left(9 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 0.68\left(6 \mathrm{H}, \mathrm{q}, J 7.8, \mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; \delta_{\mathrm{C}}(75$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 167.3(\mathrm{CHO}), 138.4(\mathrm{NCH}=C), 135.2\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 132.6(\mathrm{NCH}=\mathrm{C})$, $128.5,127.6,127.3(5 \times$ aromatic CH$), 117.6$ (aromatic C$), 116.9\left(\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\right), 59.8$ $\left(\mathrm{OCH}_{2}\right), 55.0\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 51.3\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 33.2\left(\mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 14.6\left(\mathrm{OCH}_{2} C H_{3}\right), 6.9$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{3}\right), 5.4\left(\mathrm{Si}\left(\mathrm{CH}_{2} \mathrm{Me}\right)_{3}\right) ; m / z(\mathrm{CI}+) 390\left(\mathrm{MH}^{+}, 46 \%\right), 389(66), 360(100), 349$ (57), 290 (13), 91 (72); HRMS (CI+) calcd for $\mathrm{C}_{22} \mathrm{H}_{36} \mathrm{NO}_{3} \mathrm{Si}\left(\mathrm{MH}^{+}\right) 390.2464$, found 390.2458.

[^0]:    *The less expensive $(1 R, 2 S, 5 R)$-enantiomer of menthol was used; consequently the absolute stereochemistry of the Diels-Alder adduct and its subsequent products will be opposite to those depicted in Scheme 53, and would ultimately lead to the synthesis of (+)-sarain A.

[^1]:    ${ }^{\dagger}$ The ${ }^{1} \mathrm{H}$ NMR spectrum suggests that $\sim 22 \%$ of the $\beta$-keto ester exists in the enol form in $\mathrm{CDCl}_{3}$ at r.t.: $12.01,(0.18 \mathrm{H}, \mathrm{s}), 4.58(0.22 \mathrm{H}, \mathrm{s}), 3.90(0.23 \mathrm{H}, \mathrm{dd}, J 6.9,12.2)$
