## Supplementary Table 2. Summary statistics of all loci in all populations

$\mathrm{NA}=$ Number of alleles, $\mathrm{H}_{\mathrm{O}}=$ Observed heterozygosity, $\mathrm{H}_{\mathrm{E}}=$ Expected heterozygosity. Loci significantly ( $p=<0.05$ ) deviating from HWE indicated in shaded cell, red = heterozygote deficiency, green = heterozygote excess. Significant ( $p=<0.05$ ) Fis values are shown in bold.

| Founders | Locus | NA | Ho | $\mathrm{H}_{\mathrm{E}}$ | FIS |

## Supplementary data 1. Mitochondrial DNA sequences

A 463bp fragment of the cytochrome oxidase subunit I gene was amplified for 32 individuals (16 randomly chosen samples from each island) using universal amphibian primers developed by Che et al. (2012): Chmf4, 5' - TYT CWA CWA AYC AYA AAG AYA TCG G - $3^{\prime}$;Chmr4, $5^{\prime}$ - ACY TCR GGR TGR CCR AAR AAT CA - 3'. To produce a final PCR reaction volume of $10 \mu \mathrm{l}$, the following reagents were included, $5 \mu \mathrm{I}$ Qiagen Multiplex mix, $0.6 \mu \mathrm{l}$ of $0.1 \mathrm{pmol} / \mu \mathrm{l}$ reverse and forward primer, $1 \mu \mathrm{l}$ of DNA and $2.8 \mu \mathrm{l}$ of nuclease free $\mathrm{ddH}_{2} \mathrm{O}$. The PCR conditions were as follows: $95^{\circ} \mathrm{C}$ for 15 min , followed by 35 cycles of: $94^{\circ} \mathrm{C}$ for $1 \mathrm{~min}, 56^{\circ} \mathrm{C}$ for 1 min , extension for 1 min at $72^{\circ} \mathrm{C}$; and a final extension of 10 min at $72^{\circ} \mathrm{C}$. Un-purified PCR products were sequenced in both directions using the Eurofins MWG Operon's DNA sequencing service. Sequences were verified using Sequencher ${ }^{\circledR}$ (version 5.1 ) and subsequently aligned by the ClustalW multiple sequence alignment algorithm (Thompson et al., 2002) implemented in BioEdit Sequence Alignment Editor (Hall, 1999; version 7.1.11) with the default parameters. A single haplotype was present in all individuals (GenBank accession number KX579492).

## Supplementary data 2. Definitions of extent of occurrence (EOO) and area of occupancy (AOO)

The EOO is defined as "The area contained within the shortest continuous imaginary boundary which can be drawn to encompass all the known, inferred or projected sites of present occurrence of a taxon" (IUCN, 2001). This was calculated by drawing a minimum convex polygon around the midpoints of all transects on which mountain chickens had been observed. This likely represented an overestimate as it almost certainly included areas of unsuitable habitat. The AOO is defined as "The area within its 'extent of occurrence', which is occupied by a taxon, excluding cases of vagrancy" (IUCN, 2001). This was calculated by overlaying a 500 m grid on both islands and assuming full occupancy of a grid square if mountain chicken presence had been confirmed on a transect which had its midpoint within a grid square. A 500 m grid size was chosen as it represents the best current guess of the home range size of the mountain chicken (authors' unpublished data).

## Supplementary data 3. Microsatellite primer development

Microsatellite primers for the mountain chicken were isolated commercially by Ecogenics
(Switzerland). Eight polymorphic markers (Supplementary Table 3) were then standardised using a Qiagen Multiplex PCR Kit using the following reaction mix: $5 \mu \mathrm{l}$ of Multiplex mix, 0.2 ul of $0.2 \mathrm{pmol} / \mu \mathrm{l}$
of forward primer, $0.2 \mu \mathrm{l}$ of $0.2 \mathrm{pmol} / \mu \mathrm{l}$ of reverse primer, $1 \mu \mathrm{l}$ of DNA and $3.6 \mu \mathrm{l}$ of nuclease free ddH2 $\mathrm{H}_{2}$. PCR conditions were as follows: initial denaturation at $95^{\circ} \mathrm{C}$ for 15 min , followed by 35 cycles of: 30 s at $94^{\circ} \mathrm{C}, 90 \mathrm{~s}$ at specific annealing temperature (Supplementary Table 3), extension for 60 s at $72^{\circ} \mathrm{C}$; and a final extension of 30 min at $72^{\circ} \mathrm{C}$. All genotyping was performed at DNA Sequencing and Services (Dundee) and microsatellite scoring was performed using GeneMapper (v4).

The microsatellite genotypes will be submitted to Dryad upon acceptance of this manuscript for publication, and the corresponding accession code will be provided here.

## Supplementary Table 3. Polymorphic microsatellites identified for Leptodactylus fallax

For each marker the annealing temperature $\left(\mathrm{Tm}^{\circ} \mathrm{C}\right.$ ), number of observed alleles (NOA), repeat motif (mot), PCR products allele size range in base pairs (range), combinations of primers for multiplexing (M) are shown.

| Primer Code | $\mathrm{Tm}\left({ }^{\circ} \mathrm{C}\right)$ | Primer sequence ( $5^{\prime}-3^{\prime}$ ) | NOA | Mot | Range | M |
