Appendix A: Case ascertainment for chronic rhinosinusitis

This appendix describes the case ascertainment algorithm developed, using primary and secondary care diagnostic terms and secondary care procedures, to identify patients with chronic rhinosinusitis (CRS). Certainty of the diagnosis based on this algorithm was classed as “Definite”, “Very likely” or “Likely”. All cases, irrespective of certainty of the diagnosis, were included in the current analyses.

Case identification used information collected during the study period, further restricted to dates where the patient was registered at the current general practice, and including only data after the date at which each general practice was deemed to be providing research-quality data (defined as the Up To Standard date). Cases were required to have a minimum of one year of research-quality information prior to their CRS diagnosis, and a minimum of one day of research-quality data at an individual level following diagnosis.

A.1. Definite diagnoses

A codelist comprising primary care and secondary care diagnoses, and secondary care procedures deemed to indicate a definite diagnosis of chronic rhinosinusitis (CRS) cases was developed (codelist B.1.1 Definite). Patients with one or more of these diagnoses or procedures recorded during follow-up were considered to be definite CRS cases, with the date of diagnosis taken to be the date of the first such diagnosis or procedure. These patients had received a diagnostic code specifying CRS, or had undergone surgery for CRS

A.2. Very likely and likely diagnoses

A codelist indicating primary or secondary care diagnostic terms and secondary care procedures deemed to indicate “very likely” or “likely” CRS diagnostic events was also developed. Primary care symptoms were classified into four non-overlapping categories based on the European Position Paper on Rhinosinusitis and nasal Polyps (EPOS 2012) guidelines, representing: nasal obstruction, nasal discharge, change in sense of smell, and headache. A single primary care consultation in which the patient reported symptoms classed as either nasal obstruction or nasal discharge, and additionally reported symptoms classed in any of the three remaining symptom categories was taken to be a potential “very likely” CRS diagnostic event. A diagnosis of rhinosinusitis, where chronicity was not specified was taken to be a potential “likely” diagnostic event.

Patients with no definite CRS diagnosis at any time during follow-up were deemed to be very likely CRS cases if they had two “very likely” CRS diagnostic events between 3 and 9 months apart during follow-up. The first two events satisfying this condition were identified and the date of very likely CRS diagnosis taken to be the later date of the two events.

Patients with no definite or very-likely CRS diagnosis at any time during follow-up were deemed to be likely CRS cases if they had either one “very likely” CRS diagnostic event and one “likely”, or two “likely”

diagnostic events, between 3 and 9 months apart during follow-up. The first two events satisfying this condition were identified and the date of very likely CRS diagnosis taken to be the later date of the two events.

Appendix B: Codelists

B1. CRS diagnostic terms

The following codelists were developed to identify patients with chronic rhinosinusitis:

- B.1.1. Codelist: Definite diagnostic events
- B.1.2. Codelist: Very likely diagnostic events
- B.1.3. Codelist: Likely diagnostic events
- B.1.4. Codelist: Symptoms used in determining likely and very likely diagnoses

B2. Macrolide antibiotics and penicillin

The following codelists were developed to identify prescriptions of macrolide antibiotics and penicillin:

- B.2.1. Codelist: Macrolide antibiotics
- B.2.2. Codelist: Penicillin

The following pages provide these codelists.
