Autoethnography and the doctorate in business administration: Personal, practical and scholarly impacts

Julie Davies, Frances McGregor, and Mark Horan

Authors’ copy submitted to the International Journal of Management Education

ABSTRACT

Using the Researcher Development Framework (RDF), we analyse autoethnographies in impact statements by doctorate in business administration (DBA) students to understand outcomes for self-reflexivity, management practices, and scholarship. We also use comparative data to content analyse keywords on UK business school DBA websites to explore institutional expectations. As a terminal applied research degree, the DBA is designed to generate contextualised ‘mode 2’ knowledge driven by solving organisational problems within students’ own practices. While our paper shows that DBA students value the impact of the DBA journey on themselves as reflective practitioners, only a few websites expect DBA students to publish. Consequently, we call for greater emphasis on DBA students’ potential contributions to academic publications and the growing research impact agenda. We argue that business schools should raise the ambitions of these experienced scholar-practitioners to be more fully integrated into the academy, creating greater synergies between personal impacts, practice and management scholarship in their research. Furthermore, we highlight the value of autoethnography (AE) as a useful method to incorporate self-reflexivity and to map the socialisation of DBA students within the academy. Finally, we recommend collaborative AE for DBA students and their supervisors to evidence personal, practical, and scholarly published impacts.

1. Introduction

Globally, there is strong competition in the supply of doctorate in business administration (DBA) degrees (Mellors-Bourne et al., 2016) despite Harvard Business School from 2018/19 offering the Interfaculty PhD in Business Administration instead of its longstanding DBA. The DBA is often promoted as a source of self-actualisation and status enhancement. DBA programmes provide space for management practitioners to produce Mode 2 knowledge (Gibbons et al., 1994) which is contextualised and solution focused. Banerjee and Morley (2013, p. 190) note that ‘[r]esearch conducted in professional doctorates starts from the assumption of reflective practice and its contribution is assessed based on how practice can be enhanced.’

Increasingly, the research impact agenda is gaining prominence within national research evaluation policy (e.g. Engagement and Impact Assessment in Australia; the UK’s Research Excellence impact cases). It might be assumed that at its best the DBA exemplifies what Simsek, Bansal, Shaw, Heugens, and Smith (2018, p. 2021) call ‘concurrent impact’, i.e. ‘co-creative impacts between research and practice’ that create synergies between management scholarship and practical management. Yet we suggest that March’s (2008, p. 13) assertion about the value of ‘the combination of academic and experiential knowledge’ which should be found in DBAs is not widely disseminated in well ranked academic journal articles.

The UK Council for Graduate Education (UKCGE, 2002, p. 62) defines the professional doctorate as: ‘[a] programme of advanced study and research which, whilst satisfying university criteria for the award of a doctorate, is designed to meet the specific needs of a professional group external to the university, and which develops the capability of
individuals to work within a professional context.’ This ‘within a professional context’ requires both understanding, explanation and examination of the research and the current environment and the interconnectivity between the two. Gill and Hoppe (2009) suggest that professional doctorates are a vital element in the wider research ecology and should not be viewed as a poor substitute for a PhD. In the business school context, Lockhart and Stablein (2002) emphasize the importance of DBAs for enhancing practitioners' research capabilities and connecting academia with practice without compromising outputs from either.

In this article we respond to Banerjee and Morley’s (2013, p. 183) observation that ‘not much is known about the experience of DBA candidates and graduates who have undertaken these programs’. In addition, our paper extends Farrell, Oerton, and Plant (2018) work on the importance of critical reflexivity in DBA programmes. We contextualise DBAs within the intensifying research impact evaluation agenda (see, for example Khazragui & Hudson, 2014; LSE Impact Blog). Unlike many studies on the DBA (e.g. Costley, 2013), we view the degree as a potential route to an academic career, if not full-time then for individuals with a portfolio career that includes academic teaching. We, therefore, highlight the importance of developing publishing capabilities in DBA students and graduates for them to communicate the impact of their DBA studies more effectively and extensively in the public domain.

A useful model to understand expectations of ‘doctorateness’ is the UK's Researcher Development Framework (RDF). This describes the knowledge, behaviours and attitudes of [doctoral] researchers and encourages them to aspire to excellence through achieving higher levels of development’ (QAA, 2015, p. 13). The RDF's (CRAC, 2010, p. 2) four domains include: (i) knowledge and intellectual abilities; (ii) personal effectiveness; (iii) research governance and organisation; and (iv) engagement, influence and impact. Self-reflection is a capability highlighted in the RDF second domain. We suggest this aspect is highlighted explicitly in DBA theses whereas for PhD candidates often the only references to self and the doctoral journey are in the thesis acknowledgements section (Mantai & Dowling, 2015), if at all. In management learning, Cunliffe (2009, p. 98) defines self-reflexivity as a ‘dialogue-with-self about our fundamental assumptions, values, and ways of interacting.’

The fourth RDF domain refers to publication which is listed under dissemination rather than impact. It might be expected that DBA graduates impact their immediate organisational challenges and may contribute to knowledge within professional bodies and an industry sector as well as to academic publishing and society more broadly. However, in their adapted model of practice capabilities for a DBA at an Australian university, Banerjee and Morley (2013, p. 186) omit any reference to publishing or impact when discussing communicative capability. We suggest this underestimates the quality of published outputs and lowers expectations for DBA students to be heard within the academic community.

In seeking to understand the potential for greater concurrent impacts to be communicated and published by DBA students, this paper draws on autoethnography (AE) in the impact statements of professional doctoral students in business schools. In doing so, we explore the value of both reflexivity and the impact of the DBA on the student. This paper contributes to insights into the black box of mechanisms to track identity shifts in the doctoral journey, specifically amongst DBA students, the development of their scholarly behaviours and their socialisation into academia.

We begin with an outline of the purpose and types of writing based on autoethnographic methods. We reflect on the benefits and limitations of AE. These issues include valuable self-discovery through enriching theory emotionally as well as the risks of overexposure and reputational self-harm in a public forum. We argue that AE in professional doctorates requires candidates to articulate their self-awareness and resilience beyond insights expected from a traditional PhD student. From an analysis of DBA impact statements, we
propose greater appreciation of the potential and perils of an autoethnographic lens to yield interesting insights into their transitions to the role of an independent scholar (Baker & Pifer, 2011). We discuss the implications for supervisors and doctoral students. In conclusion, we recommend further study into impact and publishing processes to enhance the impact of DBA students’ contribution to concurrent impacts of both management theory and practice and a consideration of collaborative AE.

This article addresses two questions in relation to reflexive methods and research impact: (1) ‘What are the possibilities and pitfalls of autoethnographic methods for practitioner-doctoral researchers?’ and (2) ‘How can DBA programmes contribute to the concurrent impact agenda?’ In answering these questions, DBA impact statements represent artefacts that we analyse to gain insights into the performativity of everyday self-presentation (Goffman, 1959) in management practice and the prospect for DBA students in gaining the title of ‘doctor’. This is offset against the depth of learning gained from taking time to reflect on one’s research capabilities to create meaningful impacts in academia and management practice.

On the one hand, some commentators view the mid-career professional doctoral student’s outputs in a practice doctorate as somehow inferior to the traditional PhD (Kirkman, Thompson, Watson, & Stewart, 2007). On the other hand, the DBA may be perceived as a ‘PhD plus’ (Davies, 2016) that neatly combines theory and practice with a clear sense of organisational and personal impact.

This paper is structured as follows. First, we highlight the aims and types of autoethnographic outputs. Second, we consider the potential and pitfalls of autoethnographic approaches. Third, we investigate students’ experiences in crafting impact statements to complement their DBA theses and publishable articles. Finally, we recommend further research to understand the processes involved in autoethnographic research methods and how doctoral programmes expose professional doctoral candidates to think autoethnographically about and situate their approach within a practitioner context and the growing research impact agenda.

2. The purpose and forms of autoethnographic approaches

Reed-Danahay (1997, p. 145) defines autoethnography (AE) as ‘research (graphy) that connects the personal (auto) to the cultural (ethnos), placing the self within a social context.’ This is quite distinct from positivistic approaches (Holt, 2003). Chang (2008) contends that AE must focus more than just on self-narrative and interpretation, it must also include cultural analysis. Denzin (1999, pp. 512–513) suggests that AE is inevitably political and he calls for ‘an enabling, interpretive ethnography that aspires to higher, sacred goals’ (Denzin, 1999, p. 519). At the same time, autoethnographers should protect the dignity of participants: ‘our primary obligation is always to the people we study’ (Denzin, 1989, p. 83).

Coffey (2002, p. 320) asserts that autoethnographies allow ‘the self and the field become one’ as the subject and object merge to reveal crises and epiphanies. This statement encapsulates both the value and potential risks behind this approach. Autoethnographies are distinguished, particularly in analytic AE, from autobiographies and memoirs by the examined life (Socrates) being analysed theoretically. Ellis (2004, p. xix) comments that a particular type of evocative ethnography ‘usually features concrete action, emotion, embodiment self-consciousness and introspection’. Spry (2001, p. 709) commends the ‘emotional texturing of theory’ that AE provides. Yet in a professional school like a university-based business school, emotions in fields of study such as strategy have only recently been seen as legitimate (e.g. Huy, 2011). Importantly, with respect to our concern for
impact, Doty (2010, p. 1050) highlights the advantages of AE in helping scholars to become public intellectuals, observing that ‘one of the most exciting promises of autoethnography is the potential it has to change the way we write … mak[ing] writing more accessible to wider audiences, less dry and boring to read.’

Quantitative business school researchers and students might find autoethnographic approaches incommensurate with their dominant research paradigm. For instance, Anderson (2006, p. 377) criticises evocative AE for conveying ‘emotionally wrenching experiences’ that are novelistic and lack analytical rigour. This links to a staple of the DBA programme – Socratic questioning – which seeks layers of depth and introversion to out the truth and to explore the drivers behind actions. Ellis and Bochner (2006, p. 440) defend these accusations about the lack of rigour in AE, arguing that ‘a story analysed [is] … sacrifice[d] … at the altar of traditional sociological rigor.’ Denzin (2006, p. 422) observes that autoethnographers ‘want to change the world by writing from the heart.’ The latter is also a feature of political and radical AE (Holman Jones, 2005). Novice AE researchers need to appreciate the different types of autoethnographic methods and the potential benefits and pitfalls of this approach.

3. Benefits and risks of autoethnography

In terms of the benefits of AE, Gilmore and Kenny (2015, p. 57) suggest that researchers of organisations have tended to neglect their own emotions even when they research other participants’ emotions. Denshire (2014, p. 845) claims that as an antidote to this, ‘autoethnography demonstrates the potential to speak back (and perhaps differently) about professional life under prevailing conditions of audit culture so as to make and remake ethical relations in contexts of professional practice.’ It provides space to pause and reflect on fragmented researcher identities (e.g. Kondo, 1990), and the boundaries between professional, student and personal life. DBA students can examine dichotomies and ‘hyphen-spaces’ (Cunliffe & Karunanayake, 2011) as practitioner-researchers and their academic and organisational responsibilities. In the context of higher education, AE can mitigate what Pelias (2003, p. 369) sees as superficiality in university life which is prone to creating ‘academic tourists who only manage to get to the surface of any inquiry they pursue.’

When considering potential risks, AE demands the same ethical respect for self as it does for others. Bell and Bryman (2007) have explored the potential for harm to the management researcher in organisations as distinct from medical research ethics which focus on the potential harm by researchers to patients. Autoethnographic methods not only carry the burden of authorship (Behar & Gordon, 1995) and ‘reflexivities of discomfort’ (Pillow, 2003, p. 187), but there are real concerns about the potential for self-harm for autoethnographers and the individuals implicated in their highly personal narratives. Tolich (2010, p. 1608) makes an important point that the writer should ‘[t]reat any autoethnography as inked tattoo by anticipating the author's future vulnerability’ which cannot be deleted once in the public domain. Ellis (1995) asserts that the autoethnographer must assume that anyone mentioned in the text will one day read it. Personal accounts are characterised by risk and vulnerability (Spry, 2001). Is it fair for a novice autoethnographer to publish their impact statements together with their doctoral thesis about issues that may potentially stigmatise their careers? Jago’s (2002) account of her ‘academic depression’ exemplifies this long-term vulnerability and uncomfortable reading. Moreover, AE is potentially fraught with issues of misery, regret, and intimacies that must be framed in an academic context which requires higher standards of ethics than in journalism. Chang (2008, p. 68) reminds us that ‘other people are always present in selfnarratives, either as active participants in the story or as associates in the background’. However, the well-being and prior and full informed consent of those involved
can be problematic, even with pseudonyms (Chang, 2008). Most importantly, however, Medford (2006) reiterates that autoethnographers must act ethically to safeguard confidential data that the people involved would not want others to read – even if they are anonymised.

So how do doctoral supervisors deal with the intensity of emotions generated, perceptions of naivete, and any embarrassment rather than empathy experienced by the readers of students’ autoethnographic research? Supervisors must caution students about the risks of autoethnographers sensationalising their experiences and overdramatising their lives merely to engage audiences. There is also the danger of focusing on affect rather than theoretical underpinnings to accounts, e.g. Wyatt’s (2005) evocative autoethnographic story of his father. Denzin (2003, p. 137) reconciles some of these dilemmas suggesting that autoethnographic writers will ‘strip away the veneer of self-protection that comes with professional title and position … to make themselves accountable and vulnerable to the public.’

4. AE in management research
Sensibilities and bias need to be recognised and managed in any academic research. In considering their academic peers’ views on performance in Finland for example, Kallio, Kallio, Tienari, and Hyvönen (2016) entirely ignore any discussion of their own sensibilities and biases. In contrast, Clarke, Knights, and Jarvis (2012, p. 7) acknowledge that ‘prior to the research we (as academics employed by a UK business school) held ideas about the concerns with identity amongst our academic colleagues … and these informed the construction of our interview schedule.’ Clarke and Knights (2015, p. 1870) explain that they avoid going native or being unreflective as a result of ‘continuous interrogation of our findings between ourselves and with other close colleagues’, candidly stating that ‘we do not pretend to develop constructions of reality that are either politically or morally ‘neutral’.’

While AE is widely used in anthropology, communications, education studies, health and social care, and sociology, it has been applied only to a limited degree in business and management research. Notable examples include business school scholars advocating AE as an unorthodox method to generate novel empirical data about experiencing fragmented identities at academic conferences (Learmonth & Humphreys, 2012). Anteby (2013, p. 1284) asserts that AE in management research is useful to ‘lend[s] visibility to less common experience’. Most recently in organisation studies, O’Shea (2018, p. 3) has pushed the boundaries with her ‘visceral and emotive autoethnographical account’.

5. Doctoral programmes and AE
Typically, doctoral outputs, both PhD and Professional Doctorates (PD), must demonstrate critical analysis and argument; sound methodology, structure and presentation; scholarship; a contribution to knowledge; originality and creativity with a degree of risk taking and a confident, self-critical approach. In traditional PhDs, the latter may be discussed in a section on the limitations of the research and in qualitative inquiry in the research methods section with reference, for example, to notions of the researcher-as-instrument (Guba & Lincoln, 1981; Janesick, 2003, p. 47; Patton, 2002, p. 109).

A potential problem in completing, supervising, and examining professional doctorates (PDs) is the application of non-traditional methods and outputs that strive to demonstrate criteria for originality and creativity that test narrowly worded regulations and conventional expectations (see Doloriert & Sambrook, 2011). As the doctorate is the highest-level terminal qualification, doctoral candidates in the UK must evidence excellent standards as researchers against QAA (2015) benchmarks. In this paper we suggest there is much greater scope to
embed requirements to demonstrate the impact of excellent research in doctoral training programmes. This direction of travel is gaining traction within business schools, as research impact increasingly becomes currency in measures such as Research Framework Excellence (REF). Currently, UK research council funding does not support the Doctorate in Business Administration, possibly on the assumption that employers and working practitioners will be self-funded.

The UK's 2014 Research Excellence Framework (REF) was the first to evaluate research impact which the Higher Education Funding Council (HEFCE, 2011, p. 40) defines as ‘an effect on, change or benefit to the economy, society, culture, public policy or services, health, the environment or quality of life, beyond academia.’ To its surprise, HEFCE discovered that individuals rather than employers are funding professional doctorates in England (Mellors-Bourne, Robinson, & Metcalfe, 2016). Business school directors of research who are searching for impact case studies to submit in future REF returns could be encouraged to explore the potential contributions of working executives who are completing professional doctorates which usually illustrate the influence of research findings on organisational change. Moreover, there is scope for funding bodies to work with employers to encourage executives to see the DBA rather than the MBA as a terminal degree. We argue that the policy issues of professional doctoral training and the research impact agenda present an important area for attention in the talent pipeline that does not appear to be addressed currently in the literature. In this study, we suggest that impact statements written autoethnographically as part of professional doctoral programmes are important public relations collateral to promote the importance of applied research in management education.

Doloriert and Sambrook (2011), a supervisor and PhD student pair, reflected together on the hurdles in producing an autoethnographic doctorate in a traditional business school. They noted that innovations in research methods for doctoral theses can be problematic as institutional academic regulations tend to stifle creative writing processes (except perhaps where there is a strong creative arts and design doctoral programme where performance and physical artefacts may be acceptable) despite the requirements for originality and contributions to knowledge. Business school professional doctoral student voices are rarely heard. Curiously, some DBA candidates have completed their theses about the DBA (e.g. Charity, 2010; Williams, 2011) without exploring autoethnographic research methods.

6. The stimulus for our interest in this study
We bring three distinct perspectives to this review as a DBA facilitator, DBA graduate, and current in-house DBA student. These three voices run throughout the analysis as a device for drawing out and framing the discussion. The impetus for our interest in AE in DBA programmes was in particular generated through the context of working in a university where all full-time faculty must hold doctorates or be registered on a doctoral programme. Our interest in AE was sparked by the summative assessment including the requirement for DBA candidates to submit a personal impact statement as part of the final thesis submission alongside a publishable piece of work. In their first year of the programme, DBA students write an assessed case study narrative on an organisational or leadership issue where the writer is one of the protagonists. In drafting this piece of work and within the DBA action learning sets, there is a risk of excessive self-exposure and need for adequate institutional guidelines about emotional boundary and identity work in DBA impact statements.

Additionally, as participants on the programme include colleagues of those delivering and assessing the work within the university, confusion may arise about the students' multiple roles as doctoral students, academics and senior managers, with very real concerns emerging around ownership of stories (Clandinin & Connelly, 2000). In particular, this scenario raises issues about ‘relational ethics’ (Ellis, 2007) with respect to autoethnographers' responsibilities to (in)visible characters (Chang, 2008) such as balancing the representation of close family members (Wall, 2008).

7. Research design

We recognise the potential risks in close-up studies (Alvesson, 2003) of researching our own sector. However, the authors’ familiarity with the doctorate in business administration ethos and purpose enabled discussions in the research team to question assumptions within our analysis in comparing key themes emerging from the data. This small-scale study is a textual analysis of four impact statements produced by one year's cohort of students (labelled D1, D2, D3, and D4) who completed their professional doctorates in a modern full-service university-based business school in the UK. D5 is a current student on the DBA. Table 1 summarises the five research participants' characteristics. An initial textual analysis revealed 13 key themes: fragmented identities; learning journey; personal change and resilience; learning insights; motivation; transitions; critical incidents; political AE, affirming values, morality, ethics; transformative outcomes, discovery; action learning set cultural experiences, relations with others; emotions – evocative AE, self-disclosure, discomfort; research insights – analytical AE; post DBA identity, aspirations, self-value. These themes were then mapped against four groups on the Researcher Development Framework (CRAC, 2010) listed in the introduction.

8. Findings

The analysis emphasised the interplay of dualities of self and culture and the tensions and discoveries between the two as the DBA student is socialised as a scholar-practitioner. Tables 2–5 present key themes from the DBA students' impact statements in our sample written in various forms of evocative, analytical, and political autoethnographies. These are supplemented by the views and perceptions of a student who is currently studying the DBA (D5). Clustering students’ comments within the four domains of the RDP framework groups shows how their capabilities have developed during their doctoral journeys.
In the impact statements written by D1, D3 and D4, the individuals used the DBA as a route to move from demanding full-time corporate jobs to attain a different work-life balance and find new intellectual challenges more aligned with their personal values. D5 is a lecturer who moved into academia from a senior professional role who is currently studying the DBA. In relocating from an increasingly bottom-line mandate in healthcare overseas, D1 reflected on regaining equanimity, averting derailment. She reiterated her resilience and grit, her capabilities in managing her work-life balance that is driven by her courage to embrace change and passion for life-long learning. In terms of impact, this DBA graduate discusses her intentions ‘to make a difference’ as a ‘confident researcher’, with her ‘own voice’ using the skills of framing situations and coding. No reference is made to publishing aspirations in terms of bridging practice and theory, policy work, or her role in facilitating research workshops. In view of D1’s journey from despair to exhilaration and appreciation of mutual peer support, the account suggests a focus on actual concurrent impacts would be valuable to ground the transformational journey through critical self-reflexivity over the course of the DBA.

The impact statement for D2 again highlights a sense of the ‘other’ in self-reflections. In this case, female v. male, public v. private sector, and humanities v. financial/legal backgrounds led to a similar loss of personal self-confidence felt by D1. The themes of letting go, of delegating work, and seeking intellectual challenge and a more inclusive style of working to make space for self-reflection and to contemplate the impact of public policy market pressures were important elements of the narrative. Importantly, D2 was open to more evidence-based arguments, peer support, and theoretically framing management problems over the course of the DBA. Yet there was no change in job role but a focus by D2 on enhancement and greater confidence which may reflect an in-house employer-funded degree. Again, no aspirations to publish were mentioned which indicates that reflective practice was privileged over broader concurrent impacts.

For D3, the only male DBA graduate in the sample, once more the theory-practice link was emphasised alongside a public value ethos. However, no reflections on self-confidence were mentioned, in stark contrast with the women’s voices. Like D2, there was a concern with understanding changes in government policy and resistance to New Public Management and profit orientations. As for D1, D3’s DBA coincided with a transition from being an employee to more personally fulfilling interim work experiences underpinned by their enhanced research skills. Again, however, there was no concrete evidence about how the individual’s ‘original contribution of practical relevance’ was published to evidence concurrent impacts beyond the DBA thesis.

12. Transformative outcomes, discovery

Self-discovery. ‘We shall not cease from exploration, and the end of all our exploring will be to arrive where we started and know the place for the first time’ (Eliot, 1943, p. 39). Recovery of own voice. A healing process. Reached stage seven of Kitchener and King’s (1990) reflective judgment model: willingness to re-evaluate the adequacy of one’s judgments as new data or new methodologies become available. Enhanced research skills, original contribution of practical relevance. Integration of work-life and academic study. A line of future research and development of expertise. Integration of study into teaching and use of the enhanced understanding of research and philosophy have helped guide and challenge Master’s level students. Still on the journey towards research efficacy and confidence.

D4 illustrated a career change into a full-time academic position during the DBA with responsibility for teaching courses approved by her professional body. The individual felt that the DBA was an opportunity to take personal responsibility for her life-long learning to compensate for the lack of support in secondary school for her to excel despite suggestions at the time that she was ‘Oxbridge material’. Curiously, in hindsight this respondent also felt that the DBA let her down in not developing her academic publishing skills that are required for REF publishing and impact expected of her in her full-time academic position. As in the other examples of female DBA students, personal resilience, self-esteem, self-confidence, and self-determination were highlighted in the self-reflections. This was coupled with a sense of being more rounded, authentic, and able to cope with work-life-study balance because the DBA was ‘her’ agenda. This DBA graduate overcame illness and a spouse's workplace redundancy to complete her DBA which represented a form of career future proofing in uncertain times. D4 criticised the action learning and highly reflective methodologies adopted throughout the delivery of her DBA programme that she felt were misaligned with her own preferences for grounded theory in her thesis.

Finally, D5 provides an example of a DBA student who is mid-way through the journey and who is required by his current academic employer to publish in peer reviewed journals. D5 is still experiencing imposter syndrome. D5 comes from a practitioner background and despite having moved into academia almost 10 years ago, he still passionately feels the need to focus on the practical value of research. He views himself as a ‘pracademic’ (Posner, 2009) with its positive, rather than derogatory, connotations of bridging theory and practice effectively. The impact statement is, therefore, core to this individual's framing of value by ensuring that he is in touch with his authentic values in producing research that is of direct practical relevance to the external world and his academic job.

None of the DBA impact statements was concerned with seeking career advancement as a goal that was considered more important than learning and self-fulfilment. The mandate for D5 to complete a doctorate to continue to work in his academic role in a particular university that is seeking AACSB accreditation was a source of personal frustration and annoyance.

Overall, there was a sense of the individuals developing professional research skills and making the world a better place. The DBA helped them to become more attuned to their values and public value. The doctorate helped the students to change from a narrow focus on being ‘business-like’ and on profits and shareholder value. There were substantial mid and end of career realisations that these individuals discovered about changing themselves and moving on from predicaments where they had felt trapped and intellectually unfulfilled.

Our analysis of these statements suggests that research insights were mainly related to personal growth, understanding self and government policies and conversations with immediate DBA peers. The impact statements did not illustrate that D1, D2, and D3 who were not working in academia were so driven by a sense of public and academic engagement to sustain a place in the culture of the academy after graduation. The exception was D4 who was immersed in academia but who felt insufficiently equipped to publish on graduation. This is then given further context and granularity by considering the responses of a student still on the DBA journey (participant D5).

To complement comments from DBA students in this single institutional case study, like Poole (2018) we looked at DBA websites. We updated Banerjee and Morley’s (2013) website analysis of DBA offerings by UK business schools listed in The Complete University Guide, 2019. A comprehensive review of the publicity materials of 33 UK universities has indicated very little mention of ‘reflection’ in any guise. There is also a variance in expected outcomes: self-development is usually the main selling point followed by contribution to
professional practice. Only one university mentions the contribution of DBA students as members of the university's research community: Our DBA and DProf participants become active members of our research community … Members of this community are true practitioner researchers (University of Chester). Only one university in Scotland alludes to DBA students’ work being included in peer-reviewed journals: you'll join our economics research community … you'll be encouraged to submit and present papers … to be considered for publication in academic journals (University of Strathclyde, Economics DBA). We found that four universities state that academic publication skills are developed to enable DBA students to publish: Develop writing skills to enable you to submit researched work for publication (Leeds Beckett). DBA graduates … have the ability to … produce first-class original research of publishable quality (University of South Wales). develop transferable skills in … academic publishing (Anglia Ruskin University). Some of our students do publish in leading academic and practitioner journals (University of Bradford). Only business schools at the University of Sterling and University of South Wales indicate that the DBA could offer a route into academia. In contrast, Henley Business School specifically states that the DBA is especially beneficial for a business school academic who is seeking a doctoral qualification: The programme will be of particular benefit to experienced senior executives, consultants, management educators and business school academics. The requirement for business school faculty members to complete an in-house doctorate is a strategy to fulfil AACSB accreditation standards (Stoten, 2016) – this practice may be subject to accusations of conflicts of interest as colleagues become supervisors and students.

9. Discussion and conclusion
Our paper has extended Farrell et al.'s (2018, p. 378) concern for ‘wastage’ on DBA programmes where the academic potential of students is lost. By replicating Banerjee and Morley's (2013) analysis of keywords on UK business school websites for the DBA, we have demonstrated that this concern is justified. Only a few business schools state that DBA students are expected to generate academic publications. Methodologically, we have shown that DBA students' reflections illustrate the utility of AE in management research which has tended to limit the self-revelatory accounts found in disciplines such as sociology. The self-commentary provided in the impact statements in Tables 2–5 that were analysed and clustered according to the RDF framework in this study demonstrate the value of AE for analysing DBA students’ insights. In assessing the limitations of these self-evaluations, we might ask whether the DBA students have rationalised and sanitised their accounts to avoid appearing emotionally ‘immature, primitive, or even pathological’ (Lutz, 1988, p. 41).

Tables 2–5 illustrate that practitioner doctoral students gain confidence over time in re-defining themselves as they transition between their affiliations with different milieus as executives and students. AE helps them to verbalise their insecurities and anxieties about finding their own voices. This requires skilful storytelling and literary skills that take time to develop in appreciating their own progress and the new academic culture they are becoming part of. The individualising focus on the ‘I’ in autoethnographic writing is complemented by the camaraderie of professional doctorate cohort programmes (Mellors-Bourne et al., 2016, p. v) and in the case of the DBA students in this research provides them with an empathetic audience. Nevertheless, supervisors must take responsibility for professionally ‘containing’ doctoral students’ emotions which can drain the resources of the key stakeholders involved. Doctoral impact statements serve a useful purpose in going far beyond what Gilmore and Kenny (2015) note is often seen as tokenistic researcher self-reflexivity written mechanically
in so many research methods sections. DBA statements also provide an element of longitudinal review, identifying transitions and changes throughout the DBA journey.

The vignettes offer inspiring stories of resilience, hope and triumph in completing a thesis. In the case studies provided here, there is a strong sense of reclaiming one's intellectual capabilities in or after demanding jobs where market forces have made the DBA students question the public value of their work. This sense making and identity work give the subject as object opportunities to reflect on their emergence as professional researchers and finding their voice and renewed agency in a series of existential crises. The personal epiphanies and questioning of assumptions at best can be engaging and compelling. However, there are risks in these self-narratives being dismissed as navel gazing, confessional, overindulgent and sensational like reality TV diaries.

How do supervisors assure the quality of autoethnographic research which breaks canonical methods? How are doctoral candidates guided to ensure they respect boundaries, ethical relations and apply high ethical standards to themselves as they confront their emotions and reflect on and contextualise their intellectual growth over time? How do examiners evaluate the quality of autoethnographic accounts? Issues of generalisability, reliability, validity and legitimacy are replaced by considerations of meaningful coherence and resonance in qualitative research (Tracy, 2010). What may be cathartic and intimate for the writer may be dull, self-centred and uncomfortable for the reader and risk the privacy and safety of others. Yet the story telling qualities and cultural insights of some autoethnographic accounts may be fascinating and truly inspiring. Nevertheless, supervisors and current students need to be mindful of the candour and openness they are showing, which provide both great value and learning from the impact statement, but also present potential vulnerability that is not so immediately identifiable in a PhD thesis ‘researcher-as-instrument’ (Pezalla, Pettigrew, & Miller-Day, 2012) methodology section or in thesis acknowledgements thanking friends and family.

In terms of the impact agenda in our second question, like Farrell et al. (2018) we find that critical self-reflexivity appears to be prioritised over expectations and incentives for these professional doctoral students to publish concurrent impacts in management scholarship and management practice. As management educators in universities, there are clear opportunities to integrate impactful outputs into the growing range of professional doctorates in management.

With the UK’s intense focus on the REF impact case agenda, research pathways in research grants, and UKRI funding focused on making explicit links to the UK’s industrial and overseas aid strategies, it makes sense for business school deans and representative bodies (such as the British Academy of Management and Chartered Association of Business Schools) to lobby policy-makers and research councils to recognise the valuable impacts of DBA programmes addressing complex challenges. DBAs might explicitly be integrated into government funded Doctoral Training Centres (DTCs) and in other research funding opportunities. Better communications about the returns on research and practice at the DBA level amongst senior leaders looking to evidence their industrial/organisational achievements would help to raise the visibility of this terminal degree and its wider benefits.

We conclude that as demands intensify for university management educators to demonstrate impact in REF impact cases and research council impact pathways linked to the UK’s industrial and overseas aid strategies and UN sustainable development goals, the DBA programme represents an under-utilised source of multiple forms of impact. In raising these discussions, we contribute to contextualising professional doctoral student education within on-going debates about the ‘double hurdle’ (Pettigrew, 1997) of demonstrating scholarly excellence and management relevance. We argue that the DBA can enhance the legitimacy
and impact of business and management education (Pettigrew & Starkey, 2016) over and above the DBA’s function as a critical self-reflexive journey. We make a practical contribution in calling for further research on support systems and frameworks to enhance the academic publishing skills and ambitions of DBA students beyond their immediate workplace and personal challenges. We believe that DBA students should be encouraged to make significant and far-reaching ‘concurrent impact’ (Simsek et al., 2018, p. 2021) in both management practice and scholarly publications. There is also scope to extend AE as a method in business schools in the form of collaborative AE to support doctoral supervisors (Duffy, Wickensham-Fish, Rademaker, & Wetzler, 2019) as well as doctoral students.
