ABSTRACT

Impaired pancreatic β -cell function and insulin secretion are hallmarks of type 2 diabetes. MicroRNAs are short non-coding RNAs that silence gene expression, vital for the development and function of β -cells. We have previously shown that β -cell specific deletion of the important energy sensor AMP-activated protein kinase (AMPK) results in increased miR-125b-5p levels. Nevertheless, the function of this miRNA in β -cells is unclear. We hypothesized that miR-125b-5p expression is regulated by glucose and that this miRNA mediates some of the deleterious effects of hyperglycaemia in β -cells. Here we show that islet miR-125b-5p expression is up-regulated by glucose in an AMPK-dependent manner and that short-term miR-125b-5p overexpression impairs glucose stimulated insulin secretion (GSIS) in the mouse insulinoma MIN6 cells and in human islets. An unbiased high-throughput screen in MIN6 cells identified multiple miR-125b-5p targets, including the transporter of lysosomal hydrolases *M6pr* and the mitochondrial fission regulator *Mtfn1*. Inactivation of miR-125b-5p in the human β -cell line EndoC β -H1 shortened mitochondria and enhanced GSIS, whilst mice over-expressing miR-125b-5p selectively in β -cells (MIR125B-Tg) were hyperglycaemic and glucose intolerant. MIR125B-Tg β -cells contained enlarged lysosomal structures and showed reduced insulin content and secretion. Collectively, we identify miR-125b as a glucose-controlled regulator of organelle dynamics that modulates insulin secretion.

INTRODUCTION

Pancreatic β -cells are essential regulators of glucose homeostasis, secreting insulin in response to increases in circulating levels of the sugar(1). Nevertheless, chronic hyperglycaemia has a negative effect on β -cell function and survival, contributing to the development of the type 2 diabetes(2).

MicroRNAs (miRNAs) are ~21 nucleotide non-coding RNAs that silence gene expression post-transcriptionally and are essential for endocrine cell development and function(3). Even though β -cells contain hundreds of different miRNAs, the function of only a few has been studied in detail.

MiR-125b (miR-125b-5p) is a highly conserved miRNA widely studied in the context of tumorigenesis as an important regulator of cellular differentiation and apoptosis(4). We have previously shown that miR-125b expression increases in islets after β -cell specific deletion of AMP-activated protein kinase (β AMPKdKO)(5), suggesting that AMPK may act as a negative regulator of miR-125b expression. AMPK activity is suppressed acutely in β -cells by high glucose and lowered in islets from subjects with T2D(6).

The above observations led us to hypothesize that inhibition of AMPK in response to high glucose would result in islet miR-125b up-regulation which may mediate some of the deleterious effects of hyperglycaemia in β -cells. Here we show that high glucose increases islet miR-125b expression and that miR-125b has an important negative effect in β -cell function both *in vitro* and *in vivo* by targeting genes involved in regulating lysosomal and mitochondrial function.

RESEARCH DESIGN AND METHODS

Cells and islets culture and transfection

MIN6 and EndoC β -H1(7) cells and mouse and human islets were obtained, maintained and transfected with Lipofectamine 2000 (ThermoFisher Scientific) as described in Supplemental Methods.

CRISPR-Cas9-mediated deletion of miR-125b in EndoC β -H1 cells

EndoC β -H1 cells were infected with lentiviral vectors expressing two gRNAs targeting *MIR125B-2* and a rat *Insulin* promoter (RIP)-driven hSpCas9. Lentivirus without gRNAs were used as control. Integrating EndoC β -H1 cells were selected with puromycin. See Supplemental Methods for further details.

Generation of transgenic mice

The cassette expressing miR-125b under the control of an rtTA-inducible promoter, was excised from pBI-LTet-MIR125B and used for pronuclear microinjection of C57BL6/J oocytes at the Centre for Transgenic Models, Basel (<http://www.ctm-basel.ch/>). A founder with a unique copy of the transgene was bred with mice expressing the rtTA under the control of the RIP7 promoter (RIP7-rtTA^{+/+}). Mice bearing the transgene (MIR125B-Tg: RIP7-rtTA^{+/-}, MIR125B Tg^{+/-}) and controls (Control: RIP7-rtTA^{+/-}) were used in subsequent experiments. Doxycycline (0.5 g/L) was continuously administered from the time of mating in the drinking water. Mice had free access to standard chow or, when indicated, ketogenic diet (Ssniff, Germany). *In vivo* procedures were approved by the UK Home Office Animal Scientific Procedures Act, 1986 (Licences PA03F7F0F/PP7151519.).

RNA extraction, reverse transcription and qPCR

RT-qPCR was performed as previously described(5). For miRNA quantification, let-7d-3p (main figures) and miR-574-3p (supplemental figures) were used as endogenous controls due to their stable expression in our system(5). For mitochondria DNA/Nuclear DNA

(mtDNA/nDNA) ratio analysis, islet DNA was extracted with 40ug/ml Proteinase K in SNET buffer.

MiRISC immunoprecipitation, RNA sequencing library preparation, sequencing and analysis

MiRISC-immunoprecipitation was performed as previously described(8) with a mouse-anti-AGO2 antibody (clone E12-1C9, Abnova). Library preparation from mRNA enriched from total RNA with a NEBNext Poly(A) mRNA Magnetic Isolation Kit (NEB) and from miRISC-isolated RNA was performed using a NEBNext Ultra II Directional RNA Library Prep Kit from Illumina (NEB). Library preparation from human islets total RNA (200ng) was performed using a NEBNext Low Input RNA Library Prep kit (NEB).

Libraries were sequenced on a HiSeq4000, Mapping and differential expression analysis was performed with Salmon v1.3.0(9) and DESeq2(10).

For miRNA target identification, Total mRNA (T-RNA) and immunoprecipitated RNA (RIP-RNA) samples were treated as separate datasets and the two resulting gene lists of differential analysis were used to calculate the ratio of immunoprecipitated RNA to total mRNA (IP-RNA/T-RNA) for each gene.

Further details are provided in Supplemental Methods.

Immunoblot and Immunohistochemistry

Western-immunoblot was performed with EndoC β -H1 total protein (5-15 μ g) or 10-20 islets extract prepared with RIPA. Islets and slides from isolated pancreata for immunohistochemistry were prepared, visualized and quantified as previously described(11). Further details on the approaches used for blotting, β -cell mass, proliferation, apoptosis and cathepsin D/LAMP1 measurements, and an exhaustive list of all antibodies and kits used can be found in Supplemental methods.

Electron microscopy

MIN6 and EndoC β -H1 cells and whole isolated islets were fixed and prepared as in(12). Ultrathin 70-nm sections were examined in Tecnai Spirit or JEOL 1400 plus transmission electron microscopes. Images at 2000x magnification were analysed and quantified blindly in ImageJ as in(13).

Intraperitoneal Glucose and Insulin tolerance tests (IPGTT, ITT) and *In vivo* Insulin secretion

Mice fasted overnight (IPGTT, Insulin secretion) or for 5h (ITT) were submitted to IPGTT or ITT following administration of 1g/kg body weight of glucose or 1.2U/kg insulin (NovoRapid, ITT), respectively, as previously described(14). For insulin secretion, mice were injected with 3g/kg glucose and blood insulin levels measured using an Insulin ELISA kit (Crystal Chem) following manufacturer's instructions.

Insulin secretion and content

Cell lines and islets were submitted to glucose or KCl stimulated insulin secretion as previously described(7; 14). Secreted and total insulin were quantified using an HTRF insulin kit (Cisbio) in a PHERAstar reader (BMG Labtech, UK) following the manufacturer's guidelines. Insulin and protein content were measured by HTRF and BCA (Pierce), respectively, in RIPA cellular lysates or in full pancreas homogenates as previously described (11).

Islet fluorescence imaging

Ca²⁺ and ATP imaging was performed in whole islets with Cal-520 (4.5 μ M; Stratech) and adenovirus-encoded Perceval probe, respectively, and TIRF was performed in dissociated islets infected with an adenovirus construct for NPY-venus as in(14; 15). Mitochondria morphology analysis was performed with Mitotracker GreenTM (ThermoFisher) as in(15). See Supplemental Methods for further details.

Whole-cell voltage-clamp electrophysiology

Voltage-clamp electrophysiology was performed in dissociated β -cells using patch electrodes and generating voltage-dependent Ca^{2+} (Ca_v) channel currents through application of sequential 10 mV depolarizing steps as detailed in Supplemental methods.

Extracellular flux analysis

Oxygen consumption rate was determined using the XFe96 Extracellular Flux Analyzer and a XFe96 FluxPak (Seahorse Bioscience) in groups of 3-6 size-matched islets/well embedded in Matrigel and incubated at 3 mmol/L glucose followed by 17 mmol/L glucose and oligomycin (5 $\mu\text{mol/L}$) following manufacturer's instructions.

Statistics

Statistical significance was evaluated with GraphPad Prism 9.0 software as indicated in the Figure legends. Correlation data was estimated using R software with ppcor package(16). All data are shown as means \pm SEM. $p < 0.05$ was considered statistically significant unless otherwise specified.

Study approval

All mouse in vivo procedures were conducted in accordance with the UK Home Office Animal (Scientific Procedures) Act of 1986 (Project licence PA03F7F0F to IL) and approved by the Imperial College Animal Welfare and Ethical Review Body. For human islet experiments, islets were isolated from the locations indicated in Sup Table 9 with full approval and informed consent.

Data and Resource Availability

All data generated or analyzed during this study are included in the published article (and its online supplementary files). No applicable resources were generated or analyzed during the current study.

RESULTS

Glucose stimulates miR-125b expression via AMPK repression

To determine whether glucose regulates miR-125b expression in islets, we measured miR-125b in mouse and human islets cultured at increasing glucose concentrations. MiR-125b expression was significantly increased after culture at high (11-25mM) vs low (3.5-5.5 mM) glucose concentrations (Fig. 1A, S1A). Consistent with the possible *in vivo* relevance of these findings, expression of miR-125b in human islets was positively correlated with the body mass index (BMI) of donors, but not with their age or sex (Fig 1B, S1B,C).

Islets from β AMPKdKO mice displayed significantly higher miR-125b levels than controls when cultured at a low (5.5mM) glucose concentration (Fig. 1C, S1D) whereas miR-125b expression remained unchanged in islets cultured at high glucose (25mM). To determine whether this glucose/AMPK-dependent regulation of miR-125b also occurred *in vivo*, we fed control, β AMPKdKO or β LKB1KO (mice with a β -cell specific deletion of the AMPK-upstream kinase Liver kinase B1, LKB1/STK11(17)) animals a ketogenic (low sugar) diet. As previously showed(5), β AMPKdKO islets displayed higher levels of miR-125b than controls and the same was observed in β LKB1KO islets (Fig. 1D). Feeding a low-sugar diet resulted in a significant decrease in islet miR-125b in control animals but not in islets from β AMPKdKO and β LKB1KO mice (Fig. 1D). Moreover, culture of human islets with the selective AMPK activators C13 and 991(5) or with adenovirus encoding a dominant-negative form of the enzyme caused a small, but significant, reduction and increase, respectively, in miR-125b expression (Fig. 1E, S1E). Taken together, these results indicate that high glucose stimulates miR-125b expression in both mouse and human islets by inhibiting AMPK activity.

MiR-125b regulates insulin secretion in β -cell lines

The most important characteristic of the β -cell is its capacity to respond to high levels of circulating glucose by secreting insulin(1). Glucose-stimulated insulin secretion (GSIS) in MIN6 cells with ~40-fold increased miR-125b (Fig. S2A) following transient transfection with miR-125b mimics was lower than in control cells and these cells contained 25% less insulin (Fig. 1F, S2B). Conversely, inhibition of miR-125b function with an adenovirus encoding for a miR-125b inhibitor resulted in increased GSIS and insulin content (Fig 1G, S2C).

To explore whether miR-125b regulated insulin secretion in a human β -cell line we next generated human EndoC β -H1 cells(18) with miR-125b loss-of-function using CRISPR-Cas9 (EndoC β H1-MIR125B2-KO, Fig S3A). EndoC β H1-MIR125B2-KO cells contained ~80% less mature miR-125b than controls (Fig. S3B), showed similar viability (Fig. S3D) and, as anticipated, secreted more insulin in response to high glucose than controls, although only a small, non-significant, increase was detected in insulin content (Fig. 1H, S2D).

A high-through approach identifies miR-125b target genes

To further explore the genes and molecular pathways regulated by miR-125b, as well as its mechanism of action, we sought to explore the impact of the miRNA on β -cell gene expression and to identify direct targets in a high-throughput manner. MiRNAs guide the miRNA-induced silencing complex (miRISC), including an Argonaute protein to the target mRNAs which results in mRNA destabilization and/or inhibition of translation(19). Thus we used an experimental approach that combined overexpression of miR-125b in MIN6 cells, immunoprecipitation of miRISC/target mRNAs using an antibody against AGO2 and high-throughput sequencing and differential analysis of cellular total and immunoprecipitated RNAs(20) (Fig. S4A). As a consequence of miR-125b overexpression, we expected miR-125b targets to be reduced or unchanged (if repression occurs exclusively at the level of translation) in the total mRNA (T-RNA, Table S1) fraction and increased in the precipitated (RIP-RNA,

Table S1) fraction. Thus, for miR-125b direct targets we expect a RIP-RNA to T-RNA ratio > 1 following miR-125b overexpression. To validate our approach we sorted all genes according to RIP-RNA/T-RNA ratio (Table S1) and performed unbiased motifs enrichment analysis using cWords(21). As anticipated, cWords found a significant enrichment of miR-125b seed-matching sequences in both the 3' non-translated (3'UTR) and coding (CDS) sequences of highly ranked (high RIP-RNA/T-RNA ratio) genes (Fig. S4B), suggesting that miR-125b-mRNA target interactions occur through both these regions. 180 mRNAs were enriched in miRISC following miR-125b overexpression with an RIP-RNA/T-RNA > 1.5 (Fig. 2A, Table 1). Out of these, 60 were significantly down-regulated at the mRNA level following miR-125b overexpression (Table 1, $\text{padj} < 0.1$) and 87 contained predicted binding sites in their 3'UTRs according to TargetScan, ~50% (49) of which are conserved in humans (Table 1).

We further validated the six targets (*Taz*, *M6pr*, *Tor2a*, *Mtfp1*, *Tnks1bp1* and *Gnpat*) with the highest RIP-RNA/T-RNA ratios using luciferase reporter-based assays(20). As expected, co-transfection of miR-125b mimics reduced *Firefly/Renilla* activity ratios in cells transfected with constructs containing the *Taz*, *M6pr*, *Tor2a* and *Mtfp1* 3'UTRs, *Gnpat* CDS or three perfectly-complementary sequences to miR-125b (positive control), downstream the *Firefly* open reading frame (ORF) in the bicistronic plasmid pMiRGlo, demonstrating that miR-125b silence gene expression through those sequences (Fig. 2B). In contrast, miR-125b mimics did not affect *Firefly/Renilla* activity of the empty vector or in the presence of the 3'UTR of *Gnpat* which lacked predicted miR-125b binding sites. We failed to validate miR-125b action through *Tnks1bp1* CDS, perhaps due to the location of the binding site downstream the luciferase CDS and not within the CDS itself(22).

MiR-125b targets genes encoding mitochondrial and lysosomal proteins

To identify biological pathways and functions regulated by miR-125b we submitted the list of genes dysregulated at the RNA level (T-RNA, 306 and 317 genes down- and up-regulated, respectively, $\text{padj} < 0.1$, Table S1) as well as those identified as miR-125b direct targets with a RIP/T-RNA > 1.5 (Table 1) to a Database for Annotation, Visualization and Integrated Discovery, DAVID(23). Functional annotations with high enrichment scores included mitochondrion, tricarboxylate (TCA) cycle, sterol biosynthesis, protein transport, Golgi apparatus and endosome (Fig. 2C, Table S2), all closely associated to the capacity of the β -cells to produce and secrete insulin in response to glucose.

The gene at the top of our miR-125b-targets list, the lysosomal/Golgi-associated *M6pr* (Manose-6-phosphate receptor-cation dependent, M6PR-CD) controls trafficking of lysosomal hydrolases from the Golgi via endosomes(24) and thus may influence protein turnover and lysosomal function. Luciferase assays further confirmed the interaction of miR-125b *via* a predicted conserved miR-125b binding site in its 3'UTR (Fig. 3A) and Western-(Immuno) blot of EndoC β -H1 cells overexpressing miR-125b and EndoC β H1-MIR125B2-KO cells showed a strong down- and up-regulation in M6PR protein, respectively (Fig. 3B) without significant changes at the mRNA level (Fig. 3C, Table S3). These results confirm that miR-125b targets M6PR to repress protein production in human EndoC β -H1 cells..

We hypothesized that M6PR downregulation following miR-125b overexpression may lead to a defect in lysosomal hydrolases and an accumulation of lysosomal structures with non-digested cargos. Accordingly, electron microscopy (EM) revealed an accumulation of aberrant enlarged lysosomal structures in MIN6 cells overexpressing miR-125b (Fig. 3D).

As mentioned above, GO analysis of genes dysregulated upon miR-125b overexpression also revealed a significant over-representation of genes involved in mitochondrial function (Table S2, Fig. 2C), including one of the top miR-125b direct targets, mitochondrial fission process 1

(*Mtfp1*, also known as MTP18). Luciferase experiments further confirmed the interaction of miR-125b *via* a predicted conserved binding site in *Mtfp1* 3'UTR (Fig. 3A). MTFP1 has previously been implicated in mitochondrial fission and apoptosis in mammalian cells(25). To explore a possible role for miR-125b in controlling mitochondrial morphology, we stained MIN6 cells transfected with control or miR-125b mimics with a mitochondria-targeted green fluorescent probe (Mitotracker green). MIN6 cells overexpressing miR-125b contained the same number and overall mitochondrial area, though their mitochondria were slightly more elongated and less circular (Fig. 3E, S5A). In contrast, EndoC β H1-*MIR125B2-KO* cells revealed a marked reduction in mitochondrial area and mitochondria with a smaller perimeter, that were also less elongated and more circular (Fig. 3E, S5B). Further emphasizing the importance of miR-125b for mitochondrial homeostasis, GO analysis following RNAseq of EndoC β H1-*MIR125B2-KO* confirmed a strong enrichment in dysregulated genes associated with mitochondrial function (Fig. S5C, Table S4), including *MTFP1* (1.5 fold, p-value: 0.006, padj 0.1).

These findings suggest that relief from miR125-mediated repression leads to disruption of the tubule-vesicular network and to profound changes in the expression of genes involved in mitochondrial homeostasis which may underlie the observed improvement in insulin secretion.

MiR-125b overexpression in β -cells impairs glucose tolerance *in vivo*

Given the regulatory effect of miR-125b *in vitro*, we decided to study the role of miR-125b *in vivo* by generating a mouse with β -cell specific, doxycycline-inducible overexpression of miR-125b using a RIP7-rtTA promoter (14). *MIR125B-Tg* (*MIR125B-Tg*: RIP7-rtTA^{+/+}, *MIR125B-Tg*^{+/+}) animals contained ~60-fold more islet miR-125b than controls (Control: RIP7-rtTA^{+/+}) (Fig. 4A), whereas we didn't detect statistically significant changes in miR-125b levels in the hypothalamus, a potential site for activity of the RIP promoter (26) (Fig. S6A).

MIR125B-Tg mice showed indistinguishable weight gain compared to controls (Fig. S6B) whereas random-fed glycaemia was significantly higher in MIR-125B-Tg in both males and females (Fig. 5B). Consistently, MIR125B-Tg mice were highly glucose intolerant (Fig. 4C,D), though fasting glycaemia was unaffected. No changes in glucose tolerance were observed in animals bearing the transgene in the absence of rtTA (-rtTA Control: RIP7-rtTA^{-/-}, MIR125B OE^{+/-}, Fig. S6C), demonstrating that the defects observed were not due to an off-target genomic event resulting from transgene integration. Blood glucose levels were efficiently reduced by administration of exogenous insulin excluding insulin insensitivity as a major player in the glucose intolerance observed in MIR125B-Tg animals (Fig. S6D). Moreover, plasma insulin did not increase in MIR125B-Tg mice in response to an intraperitoneal injection of glucose (Fig. 4E) suggesting impaired β -cell secretory function. β -cell mass and β - to α -cell ratio, as well as proliferation and apoptosis remained unchanged in the transgenic animals (Fig. 4F, Fig. S6E,F).

Taken together, these data suggest that increased miR-125b in the β -cell results in hyperglycaemia and glucose intolerance due to impaired β -cell secretory function.

MiR-125b transgenic islets contain and secrete less insulin

To further explore a cell autonomous defect in insulin secretion, we measured GSIS in isolated islets from MIR125B-Tg mice which showed a strong reduction in insulin secretion in response to glucose or depolarisation by KCl (Fig. 5A, Fig. S6G). Consistent with our previous data in MIN6 cells, MIR125B-Tg islets contained less intracellular insulin (Fig. S5H), as further confirmed by Western blot (Fig. 5B, S6I), revealing lower levels of both intracellular pro-insulin and insulin. Accordingly, MiR125B-Tg pancreata contained less insulin (Fig. S6J). These data indicate a reduced capacity of MIR125B-Tg β -cells to produce and secrete insulin.

Upon entry in the β -cell, glucose is rapidly metabolized by mitochondria, causing a sharp increase in intracellular ATP/ADP ratio, closure of ATP-sensitive K^+ (K_{ATP}) channels, plasma membrane depolarization and Ca^{2+} influx into the cytosol to trigger insulin exocytosis(1). The fact that secretory responses to both high glucose and KCl were impaired in MIR125B-Tg islets suggested defects downstream of glucose metabolism. Accordingly, the glucose-mediated ATP/ADP rise and the basal ATP/ADP ratio were similar in MIR125B-Tg and Control isolated islets (Fig. 5C, D). OCR increases induced by high glucose and in response to the inhibitor of mitochondrial ATP synthase oligomycin were also comparable (Fig. 5E), confirming similar mitochondrial capacity to generate ATP. In contrast, both basal and oligomycin-insensitive respiration were significantly elevated in MIR125B-Tg islets (Fig. 5E), suggesting increased inner mitochondrial membrane proton conductance. Additionally, MIR125B-Tg islets showed a strong reduction in glucose-induced changes in intracellular Ca^{2+} (Fig. 5F). KCl-induced rises in Ca^{2+} were similar between MIR-125B-Tg and Control islets (Fig. 5F), suggesting that MIR125B-Tg β -cells contained functional voltage-gated calcium channels (VGCC). This was further confirmed in single β -cells by whole-cell voltage clamp that showed similar VDCC currents (Fig. 5G). The kinetics of individual fusion events were also identical in cells from MIR125B-Tg or Control islets (Figure 5H), as assessed by total internal reflection of fluorescence (TIRF) imaging of neuropeptide Y (NPY)-Venus-expressing vesicles near the plasma membrane(27), indicating that vesicle fusion itself was not affected by miR-125b overexpression.

Enlarged lysosomes/autophagolysosomes are abundant in miR-125b transgenic islets

Our previous experiments in cell lines pointed to miR-125b as a regulator of mitochondrial and lysosomal function, which could contribute to defective insulin secretion. In contrast to our observations in cell lines, but consistent with an efficient capacity to generate ATP in response to glucose, mitochondrial area and morphology and the levels of mitochondrial DNA (mtDNA,

Fig. 6B) were comparable in MIR125B-Tg and Control islets (Fig. 6A,B). Even though lysotracker staining revealed no differences in lysosomal area or numbers (Fig. S6K), transmission electron microscopy (TEM) identified the presence of enlarged lysosomes and autophagosomes in the MIR125B-Tg islets which were rarely found in control samples (Fig. 6C,D). Moreover, islets co-immunostaining identified a significant reduction in the lysosomal protease cathepsin D localized to (LAMP1-positive) lysosomes (Fig 6F). TEM also revealed a sharp reduction in the number of dense-core insulin granules, and an increase in granules with defective crystallization (light-core, abnormal rod-like or empty) (Fig. 6C,E). Importantly, fewer secretory granules were present within 200nm of the plasma membrane in MIR125B-Tg than in Control islets (Fig. 6E).

β-cell identity is altered in MIR125b-Tg islets

To shed more light into the molecular mechanisms underlying the secretory defects of miR-125B-Tg islets, we performed RNA-seq on MIR125B-Tg and Control islets. 320 and 398 genes were significantly ($p_{adj} < 0.1$) down- and up-regulated, respectively (Table S5).

GO analysis of downregulated genes identified a strong enrichment within pathways and processes associated with mature β-cell function such as regulation of insulin secretion and endocrine pancreas development (Table S6, Fig. 7A,B, S7A), with a significant reduction of several important β-cell identity genes such as *Ucn3*, *Pdx1*, *NeuroD1*, *Nkx2.2*, *Slc2a2* and *Nkx6.1*. These genes don't contain predicted miR-125b binding sites or had been identified as direct miR-125b targets in our RIP-seq experiments, suggesting an indirect effect. Further supporting a loss of β-cell identity, up-regulated genes were significantly associated with neuronal features (Table S6, Fig. 7A,S7B). We also observed an upregulation of many glycoprotein genes and of genes associated with cellular and focal adhesion, signalling

pathways and voltage-gated and potassium channels. Golgi-associated genes were both up and down-regulated Table S6, Fig. 7A, S7B).

MiR-125b alters insulin secretion and gene expression in human islets

To further explore the relevance of miR-125b in human β -cells, we performed GSIS assays in human islets infected with Ad-MIR125B, achieving a ~4.5 fold increase in miR-125b levels (Fig. S8A). MiR-125b overexpressing islets secreted ~50% less insulin than controls, though their insulin content remained unchanged (Fig. 7C, S8B). Additionally, we performed RNA-seq in dissociated human islets infected with these virus, achieving a ~3 fold increase in miR-125b (Fig. S8C). Principal component analysis (PCA) showed that most of the variation was due to the donor origin of the islets (Fig. S8D) and, thus this experiment was underpowered (~20% to detect a 2x Fold change with $p < 0.01$, calculated using Scotty(28)). Nevertheless the expression of hundreds of genes tended to be altered (p -value < 0.05 , Table S7) and Gene Set Enrichment analysis of all the genes ranked by gene expression fold change identified a significant enrichment in several biological pathways (Fig. S8E,F, Table S8) notably including lysosomal ($p < 0.0001$, FDR=0.07) and calcium signalling ($p < 0.0001$, FDR=0.06). Further suggesting a role for miR-125b in lysosomal function, a downregulation in M6PR protein was observed in dissociated human islets infected with Ad-MIR125B (Fig. 7D).

DISCUSSION

Even though elevated levels of circulating miR-125b in association with higher HbA1c in T1D(29) and T2D(30) have been previously identified, this is the first study to demonstrate that miR-125b expression is induced by glucose in mouse and human islets in an AMPK-dependent manner. Although our capacity to demonstrate a correlation between hyperglycaemia and islet miR-125b levels in human islets *in vivo* was limited by the lack of

HbA1c data, we found a significantly positive correlation with donor BMI which often associates itself with HbA1c(31).

Despite being highly expressed in β -cells, the function and mechanism of action of miR-125b in these cells have remained elusive until now. Here, we show for the first time that elevated expression of this miRNA in β -cells impairs their secretory function *in vitro* and *in vivo*.

We have generated a novel transgenic model capable of β -cell selective overexpression of miR-125b. These animals were hyperglycaemic and strongly glucose intolerant and presented a drastic reduction in circulating insulin following a glucose challenge.

Our findings suggest two main causes for the secretory defects in the MIR125b-Tg mice: strong impairment in GSIS and reduced insulin content. Unlike ATP, cytosolic Ca^{2+} increases following glucose stimulation were substantially lower in MIR125b-Tg islets though, paradoxically, similar levels of Ca^{2+} were observed upon membrane depolarization with KCl, even though KCl-stimulated insulin secretion was also strongly impaired. This points towards defects at different levels on the secretory pathway, as supported by the striking changes in gene expression. First, K_{ATP} -independent amplification pathways(32) might be impaired in MIR125B-Tg islets, which display lower levels of genes encoding enzymes limiting for the production of guanine nucleotides and glutamine such as *Imphd1* and *GLUL* that can promote insulin exocytosis in an ATP/ADP independent manner(33; 34). Secondly, voltage-clamp electrophysiology experiments confirmed the presence of functional voltage-dependent Ca^{2+} -channels in MIR125B-Tg β -cells. MIR125B-Tg islets expressed normal levels of Ca^{2+} -channels but higher levels of PMCA3 and the $\text{Na}^{+}/\text{Ca}^{2+}$ -exchanger NCX3, members of protein families responsible for Ca^{2+} extrusion in β -cells, which could potentially contribute to reduced levels of cytosolic calcium. Thirdly, TEM revealed fewer granules in close proximity to the plasma membrane in MIR125B-Tg β -cells and our RNAseq identified a strong alteration in

genes involved in cellular granule docking and fusion such as granuphilin (*Syt14*), the SNARE protein *Vamp3* and synaptotagmins (*Syt1/12/17*) (35; 36), pointing towards defects in the final steps of exocytosis. Finally, MIR125B-Tg islets present defective granule crystallization which might be partially due to reduced levels of the zinc transporter *Znt8* mRNA (37). Loss of β -cell identity might further contribute to these secretory defects, though some of these transcriptional changes may occur as a consequence of the moderate fed hyperglycaemia in these animals(38) or be residual from impaired maturation since RIP7-rtTA-driven transgene expression is expected to occur from E11.5.

Here, we unbiasedly identified dozens of miR-125b targets through the integration of RIP-seq and RNA-seq data(8; 20) of miR-125b overexpressing MIN6 cells. Given the supra-physiological levels of miR-125b achieved in these experiments, additional loss-of-function experiments will be key to confirm the targeting. It remains to be studied whether some of these targets are shared with the family member miR-125a, also expressed in β -cells. Additionally, some of these targets might not be conserved in humans and this may explain the fact that miR-125b modulation affects insulin content in mouse β -cells but less so in humans. Intriguingly, dishevelled binding antagonist of beta catenin 1 (*Dact1*) was not within this list and remained unchanged upon miR-125 manipulation in all our experimental models. *Dact1* was previously identified as a miR-125b target in β -cells, perhaps due to the presence of other pancreatic, highly proliferative cells in the samples(39).

One of the genes at the top of our list of miR-125b targets, *M6pr*, encodes the cation-dependent manose-6-phosphate protein MP6R (CD-M6PR). Even though the function of CD-M6PR remains unknown in β -cells, this receptor is necessary for adequate lysosomal targeting of several hydrolases such as Cathepsin D(40). Remarkably, MIR125B-Tg islets contained less cathepsin D in their lysosomes, which appeared enlarged similarly to those observed by Masini et al. (41) in T2D islet micrographs, suggesting the accumulation of undigested cargos. Defects

on the lysosomal/trafficking machinery can also affect the maturation, packaging and location of the secretory granules within the cell(42) and might contribute to the reduced insulin content and crystallization defects observed in the MIR125B-Tg mice. Whether elevated miR-125b during hyperglycemia/loss of AMPK activity contribute to these processes in T2D and how, remains to be studied.

Even though we had identified several genes encoding mitochondrial proteins as miR-125b targets in MIN6 cells, no mitochondrial morphological defects were detected in the transgenic islets, suggesting that endogenous miR125b levels are sufficient to exert maximal effects on mitochondrial structure. However, several mitochondrial genes were dysregulated in MIR125B-Tg islets and seahorse experiments showed a significant increase in basal and oligomycin-insensitive respiration, suggesting certain extent of mitochondrial dysfunction.

On the other hand, deletion of miR-125b in EndoC β -H1 cells resulted in a strong alteration of mitochondrial morphology and in the expression of mitochondrial proteins, including the miR-125b targets *Mtfp1* and *Gnpat*. *Mtfp1* is targeted by miR-125b in monocytes to promote elongation of the mitochondrial network (43). GNPAT acts to stabilize DRP1(44) , which is required for mitochondrial fission and which deletion impaired insulin secretion(45; 46). In line with these earlier studies, EndoC β -H1-MIR125B2-KO cells contained shorter mitochondria which correlated with increased GSIS. It has, however, been contested whether mitochondrial fragmentation promotes apoptosis or correlates with hyperglycaemia or diabetes(15; 47). Importantly, we did not observe any differences in cellular death or number in EndoC β -H1-MIR125B2-KO neither in *Ddit3* (CHOP) mRNA levels, suggesting an absence of mitochondrial-induced ER stress in these cells. Future experiments are required to determine whether the positive effects of miR-125b elimination in β -cell function persist under conditions of cellular stress.

In summary, our results suggest that β -cell miR-125b has the potential to act as a glucose-regulated metabolic switch between the lysosomal system and mitochondria dynamics. Whole-body *MIR125B-2* knockout mice on a high-fat diet develop insulin resistance and glucose intolerance possibly due to the white fat accumulation (48). Nevertheless, insulin secretion or an effect in other metabolic organs were not assessed and our study provides compelling evidence of a role for miR-125b in controlling insulin secretion and strongly indicates that non-targeted administration of miR-125b mimics may reach the islet and lead to defective β -cell function and worsen diabetes.

Future studies focussed on β -cell-specific inhibition of miR-125b and on the function of specific targets will be essential to confirm a potential therapeutic benefit of targeting this miRNA or its targets for the treatment of diabetes.

AUTHOR CONTRIBUTIONS

R. Cheung & G. Pizza (equal contribution) performed most experiments, designed research studies and obtained and analyzed data; P. Chabosseu performed research studies (TIRF) and designed microscopy macros. D. Rolando assisted with computational analysis of RNA-seq and RIP-seq data. A. Tomas and T. Burgoyne performed TEM experiments. Z. Wu, A. Salowka, A. Thapa, A. Macklin and Y. Cao performed research studies (insulin secretion, β -cell mass and apoptosis and Western blot, respectively). M.-S. Nguyen-Tu assisted with animal studies (*In vivo* Insulin secretion). M. T. Dickerson and David Aaron Jacobson performed whole-cell voltage clamp experiments. P. Marchetti, K. Bouzakri, J. Shapiro, L. Piemonti and E. de Koning, provided human islets. I. Leclerc assisted with maintenance of animal colonies. K. Sakamoto and D. M. Smith provided C13 and C991, respectively. G. A. Rutter contributed to the study design, with reagents and AMPK and LKB1 KO animals, and in writing the

manuscript. A. Martinez-Sanchez conceived the study, designed and performed experiments, analyzed data, and wrote the paper; All authors read and approved the manuscript. A. Martinez-Sanchez is the guarantor of this work and, as such, had full access to all the data in the study and takes responsibility for the integrity of the data and the accuracy of the data analysis.

ACKNOWLEDGEMENTS

The authors thank Stephen M. Rothery from the Facility for Imaging by Light Microscopy (FILM) at Imperial College London for support with confocal and widefield microscopy image acquisition and analysis.

A.M-S was supported by an MRC New Investigator Research Grant MR/P023223/1. G.A.R. was supported by a Wellcome Trust Senior Investigator Award (WT098424AIA) and Investigator Award (212625/Z/18/Z) and MRC Programme grants (MR/R022259/1, MR/J0003042/1, MR/L020149/1). A.T was funded by the MRC (MR/R010676/1). IL was supported by a Diabetes UK project grant (16/0005485). This project has received funding from the European Union's Horizon 2020 research and innovation programme via the Innovative Medicines Initiative 2 Joint Undertaking under grant agreement No. 115881 (RHAPSODY) to G.R. and P.M. Human islet preparations (Milan, Italy) were obtained from the European Consortium for Islet Transplantation; the Human Islet Distribution program was supported by Juvenile Diabetes Research Foundation Grant 3-RSC-2016-160-I-X.

Table 1. MiR-125b direct targets identified by integration of RIP-seq and T-RNA-seq differential analysis. Genes (180) with RIP-seq to T-RNA ratio > 1.5 are shown. FoldC_T-RNA and padj_T-RNA= Fold change and adjusted p-value of differential analysis of transcripts in MIN6 cells transfected with miR-125b mimics vs controls. FoldC_RIP and padj_RIP= Fold change and adjusted p-value of differential analysis of Ago2-immunoprecipitated RNAs in MIN6 cells transfected with miR-125b mimics vs controls. Predicted binding site TargetScan=Y indicates the presence of at least one predicted miR-125b binding site by TargetScan mouse v7.2. * (Y*) indicates target conservation in humans.

FIGURE LEGENDS

Figure 1. MiR-125b expression is stimulated by glucose via AMPK repression in islets and regulates insulin secretion in insulinoma/ β -cell lines. RT-qPCR measurements of **A-E**, MiR-125b in **(A)** mouse and human islets cultured at the indicated glucose concentrations for 48h, **(B)** human islets (from non-diabetic donors) kept for 24h at 5.5mM glucose plotted against donor's BMI, **(C)** islets from β AMPKdKO (green) and control (C, black) mice cultured at 5.5 or 25mM Glucose for 48h, **(D)** islets from β AMPKdKO (green), β LKB1KO (red) and control (C, black) male and female mice fed a chow or a ketogenic (Keto) diet for 28 days and **(E)** human islets treated with the AMPK activators C-13 (50nM) and C-991 (20nM) for 16h (left hand-side) and dissociated human islets infected with adenovirus expressing a dominant-negative AMPK protein (Ad-AMPK-DN) or empty control (Ad-GFP) at 5 MOI for 48h (right hand-side panel). Each dot represents islets from a single mouse or human donor. MiR-125b expression is normalized to that of the endogenous control let-7d-3p (4). **F-H** Glucose-stimulated insulin secretion (GSIS, left hand-side panels) and insulin content (right hand-side panels). GSIS was quantified after 30 minutes of 17 or 15 mM glucose stimulation following overnight preincubation at 3 mM glucose of MIN6 **(F, G)** and EndoC β -H1 with CRISPR-mediated miR-125b knockout **(H)**. MIN6 cells were transfected with 5nM miR-125b (125b) or control (C) mimics **(F)** or infected with adenovirus expressing a miR-125b inhibitor (125b-OFF) or a non-targeting control (C) at 10 MOI **(G)** 48h before the experiments. Intracellular protein content was quantified by BCA to calculate insulin content per μ g of total protein. Data is presented as fold change of basal level. Each dot represents an independent experiment with two-three technical replicates. Experiments were performed with three different populations of CRISPR-mediated miR-125b KO and control cells. Error bars represent SEM. ns=no significant, * p <0.05, ** p <0.01, *** p <0.001, one-way ANOVA (repeated measures) and Dunnett multiple comparisons test (A), Pearson Correlation adjusted by age and sex (B), two-

way ANOVA (repeated measures) and Bonferroni multiple comparisons test (C), unpaired Welch (D) and paired Student (E-H) *t* test.

Figure 2. High-through identification and validation of miR-125b target genes. MIN6 cells were transfected with 5nM control or miR-125b mimics **A)** Cytoscape(49)-generated layout of genes with RIP-RNA/T-RNA ratio > 1.5 upon miR-125b overexpression (arbitrary cut-off) in MIN6 cells were transfected with 5nM control or miR-125b mimics. Node size represents the extent of the RIP-RNA/T-RNA ratio (the larger, the higher). The intensity of the gene node colour indicates the fold downregulation of each gene upon miR-125b expression (T-RNA). Downregulation at the transcript level was statistically significant for those genes represented in an octagonal shape. Lines connecting the nodes/genes with miR-125b indicate the presence of a predicted binding site for miR-125b as identified by TargetScan, with the intensity in the colour of the line representing the score (Total context score). **B)** Validation of miR-125b binding to the regions (full-length CDS or 3'UTR, as indicated) containing predicted miR-125b binding sites of six identified targets with highest RIP-RNA/T-RNA. Luciferase reporter assay of MIN6 cells cotransfected with pmirGLO plasmids containing the indicated target downstream the luciferase ORF and miR-125b (+) or non-targeting (-) control mimics. Samples were measured 24h after transfection in technical replicates. *Firefly* luciferase values are normalised to *Renilla*, independently expressed by the same vector and are shown as relative to that obtained for each construct cotransfected with the control miRNA mimic. Each dot represents an independent experiment. A construct containing three perfectly complementary binding sites for miR-125b (positive control) and the empty pmirGlo vector (negative control) were included in the experiments. **C)** Gene Ontology enrichment analysis of the genes significantly up- and down-regulated upon miR-125b overexpression (T-RNA) and putative miR-125b direct targets (RIP-RNA/T-RNA > 1.5) performed with DAVID. The graph shows enrichment scores for one representative term for each cluster grouped by semantic similarities and including terms with a *padj* (Benjamini) < 0.05. See Supp Table 2 for a full list

of terms. Error bars represent SEM. * $p < 0.05$, *** $p < 0.001$, **** $p < 0.0001$, paired Student t test values of the log[fold change] values.

Figure 3. MiR-125b represses *M6pr* and *Mtff1* and alters lysosomal and mitochondrial morphology. **A)** MIN6 cells were transfected with luciferase reporters containing the *M6pr* or the *Mtff1* 3'UTRs with (mutated, MUT) or without (wild-type, WT) three/two point mutations in the sequence complementary to the miR-125b seed. Control (-) or miR-125b (+) mimics were co-transfected and *Firefly* luciferase values normalized to *Renilla*. Each dot represents an independent experiment. **B)** Representative Western blot showing reduced (left-hand side panel) and increased (right hand-side panel) M6PR protein levels upon transfection with 1nM miR-125b (miR-125b)/control (C) mimics or CRISPR-Cas9-mediated deletion of miR-125b in EndoC β -H1 cells, respectively. Bar graphs show densitometry quantification of M6PR, using ImageJ, normalized by Tubulin and presented relative to the control. **C,** Left hand-side panel: RT-qPCR measurement of *M6PR* mRNA in EndoC β -H1 cells transfected with control (C) or miR-125b (miR-125b) mimics, normalized by the housekeeping gene *Ppia* and presented as fold change of the control. Right hand-side panel: Normalized (Reads *per* Kilobase of transcript, *per* Million mapped reads (RPKM)) M6PR reads in Control vs MIR125B2-KO (KO) EndoC β -H1 cells. **D,** Representative Transmission Electron Microscopy image of MIN6 cells transfected for 48h with control (C) or miR-125b (125B) mimics. Red arrows show enlarged lysosomal structures. Scale bar = 1 μ m. These were not observed in any of the imaged controls (n=3 independent experiments). **E,F)** Quantitative analysis of mitochondria number and morphology on deconvoluted confocal images of (E) MIN6 cells transfected with miR-125b (red) or control (black) mimics or (F) EndoC β -H1 with CRISPR/Cas9-mediated miR-125b deletion (green) or controls (black). Cells were stained with Mitotracker green. An ImageJ macro was generated and used to quantify individual mitochondria length (elongation) and circularity (0:elongated; 1:circular). Each dot represents one acquisition (n=3 (E), n=4 (F) independent experiments). Lower panels show representative confocal images of the mitochondrial network of EndoC β -H1-MIR125B2-KO and control cells. Scale bar: 10 μ m. Error

bars represent SEM. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, paired Student t test of the log[fold change] values (A-C); Welch t test (E, F).

Figure 4. Mice with β -cell-selective overexpression of miR-125b are glucose intolerant and present impaired glucose stimulated insulin secretion. **A)** MiR-125b RT-qPCR in isolated islets from Control (RIP7-rtTA^{+/+}) and MIR125B-Tg mice (RIP7-rtTA^{+/+}, MIR125B Tg^{+/+}). Data are fold change vs Control. **B)** Glycaemia in 5 and 9 week old Control and MiR125B-Tg mice fed *ad libitum*. For A and B, each dot represents a single mouse. **C, D)** Glucose tolerance test in 6 and 10 week old MIR125B-Tg and littermate control male (C) and female (D) mice. $n=7-8C$, $5-7Tg$. **E)** Glucose (3 g/kg)-induced insulin secretion assessed in 10 week old MIR125B-Tg and littermate controls ($n=13C$, $11 Tg$). **F)** Pancreata from MIR125B-Tg and littermate controls were fixed and subjected to immunocytochemical analysis for insulin and glucagon. β - and α -cell masses are presented as the β -cell/ α -cell ratio and correspond to quantification of insulin-positive area/glucagon positive area ratio (left-hand side panel). β -Cell mass is presented as a percentage of the pancreatic surface and corresponds to quantification of the insulin-positive area per pancreas area quantified in whole pancreas sections. Each dot represents one pancreatic section with $n = 3$ mice/genotype. Error bars represent SEM. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$, Welch t test (A, B, F); two-way ANOVA (repeated-measures), Fisher least significance different test (C-E).

Figure 5. MIR125B-Tg islets contain and secrete less insulin than controls. **A)** Fold induction insulin secretion vs low glucose (3mM, LG) in response to 30 minutes high (17mM, HG) glucose or KCl (17mM KCl and 3mM Glucose) in islets from 10-11 week old Control (RIP7-rtTA^{+/+}) and MIR125B-Tg (RIP7-rtTA^{+/+}, MIR125B Tg^{+/+}) mice. **B)** Insulin and pro-insulin content in 10 week old Control (C) and MIR125B-Tg (Tg) mice. A representative WB is shown with islets from 3 C and 3 Tg animals. Bar graphs show densitometry quantification of insulin and pro-insulin, using ImageJ, normalized by GAPDH and presented relative to the average control. **C)** ATP rises in response to high glucose (17mM vs 3mM) and **D)** ATP/ADP ratio at 3mM glucose in intact MIR125B-Tg and control islets infected with an adenoviral Perceval

sensor. n=4-5 mice/genotype, with 1-2 acquisitions per mouse and an average of 5 islets/acquisition. **E)** Oxygen consumption rate (OCR) measured in the presence of 3mM or 17mM (HG) glucose and 5 μ M oligomycin (OM) over time as indicated. Islets were pre-incubated for 1h at 3mM glucose. Left hand-side panel shows traces from the actual experiment. Middle and right hand-side panels show calculations during the indicated periods. “Basal” shows AUC under basal (3mM) conditions, Δ HG and $-\Delta$ OM report the change in respiration when 17mM Glucose and oligomycin are added, respectively. The oligomycin insensitive value (OM insen) reports the residual respiration after the addition of oligomycin and coupling ratio (right-hand side panel) represents the oligomycin-sensitive respiration divided by respiration preceding oligomycin. Each dot represents a plate well with 3-6 size-matched islets (n=10-12) extracted from 3 Control (C) and 4 MIR125B-Tg (Tg) mice. **F)** Ca²⁺ rises in response to high glucose (17mM vs 3mM) and KCl (20mM KCl, 3mM Glucose) in intact MIR125B-Tg and control islets incubated with Cal-520. n=4-5 mice/genotype, with 1-2 acquisitions per mouse and an average of 5 islets/acquisition. AUC corresponding to HG incubation was determined and presented on the bottom. **G)** Average maximum CaV current densities recorded from control and MIR125B-Tg β -cells in response to 10 mV steps from -70 to 70 mV. N= 16 and 29 β -cells from 2 control and 4 MIR125B-Tg mice. **H)** NP-Y.Venus fluorescence increases in response to 20mM KCl in cells from dissociated MIR125B-Tg and control islets infected with an adenoviral NP-Y-venus sensor. n=3-4C mice/genotype 2 with 2 acquisitions per mouse and 1-2 β -cells per acquisition. Each dot represents a single mouse in all graphs unless otherwise indicated. Error bars represent SEM. ns=not significant * p < 0.05, ** p < 0.01, *** p < 0.001, two-way ANOVA (repeated-measures) and Bonferroni multiple comparisons test (A), paired Student (B) and unpaired Welch (D-E) or Student t test (F).

Figure 6. Enlarged lysosomes/autophagolysosomes are abundant in miR-125b transgenic islets. **A)** Quantitative analysis of mitochondria number and morphology on deconvoluted confocal images of dissociated MIR125B-Tg and Control islets from 10-11 week old mice. Cells were stained with Mitotracker green. An ImageJ macro was generated and

used to quantify number of mitochondria per cell, total mitochondria area, individual mitochondria length (elongation), circularity (0:elongated; 1:circular) and perimeter. Each dot represents one cell (n=3 mice/genotype). **B)** Mitochondrial DNA copy number, calculated as the ratio of the mitochondrial encoded gene mt-Nd1 to the nuclear Cxcl12. Each dot represents a single mouse. **C)** Representative Transmission Electron Microscopy images of MIR125B-Tg and control β -cells. Red arrows: enlarged lysosomes with undigested cargos. Blue arrows: non-crystallized insulin granules, showing a rod like structure or a grey interior. Scale bar = 1 μ m, 40nm (bottom right) interior. **D)** Number of enlarged lysosomes per field imaged. **E)** β -cell granule density. For (D, E) each dot represents one image (n=3 mice/genotype, 9-13 images/mouse). **F)** Representative confocal microscopy images of β -cells within MIR125B-Tg and control islets immunostained with anti-Cathepsin D (red) and anti-LAMP1 (green) antibodies. Yellow circles represent individual cells. Blue arrows show examples of only Cathepsin + particles and red arrows show particles with both LAMP1 and Cathepsin D + staining. ImageJ was used to quantify Cathepsin D/LAMP1 stained particles within each cell, represented in the right hand-side graph as percentage of LAMP1+ particles per cell. Each dot represents an individual islet with the average of 3-8 cells quantified per islet, extracted from 2 control (C) and 2 MIR125B-Tg mice. Error bars represent SEM. * $p < 0.05$, ** $p < 0.01$, **** $p < 0.0001$, Welch t test.

Figure 7. MiR125b overexpression alters gene expression in mouse and human islets.

A) Gene Ontology analysis of significantly ($p_{adj} < 0.1$) down-regulated (left, red) and up-regulated genes (right, green) in MIR125B-Tg islets from 6-week old mice vs controls performed with DAVID. The graph shows enrichment scores for one representative term for each cluster grouped by semantic similarities and including terms with p_{adj} (Benjamini) < 0.05 . See Supp Table 6 for a full list of terms. **B)** KEGG pathway “Insulin secretion”. Red and blue stars indicate significantly down- and up-regulated genes in MIR125B-Tg islets vs control, respectively. *Syt14* (granuphilin) has been manually added to the pathway. **C)** Glucose-stimulated insulin secretion (left hand-side panel) and insulin content (right hand-side panel)

quantified after 30 minutes of 15 mM glucose stimulation following 1h pre-incubation at 3 mM glucose of human islets infected with adenovirus expressing miR-125b (Ad-MIR125B) or a non-targeting control (C) at 5 MOI 48h before the experiments. GSIS data is presented as fold change of basal level. Each dot represents an independent experiment performed with islets from two different donors. **D)** Western blot showing reduced M6PR protein levels infection of dissociated human islets from three different donors (D1-3) infected with Ad-MIR125B or control adenovirus (2 MOI) for 48h. Bar graphs show densitometry quantification of M6PR, using ImageJ, normalized by Tubulin and presented relative to the control.

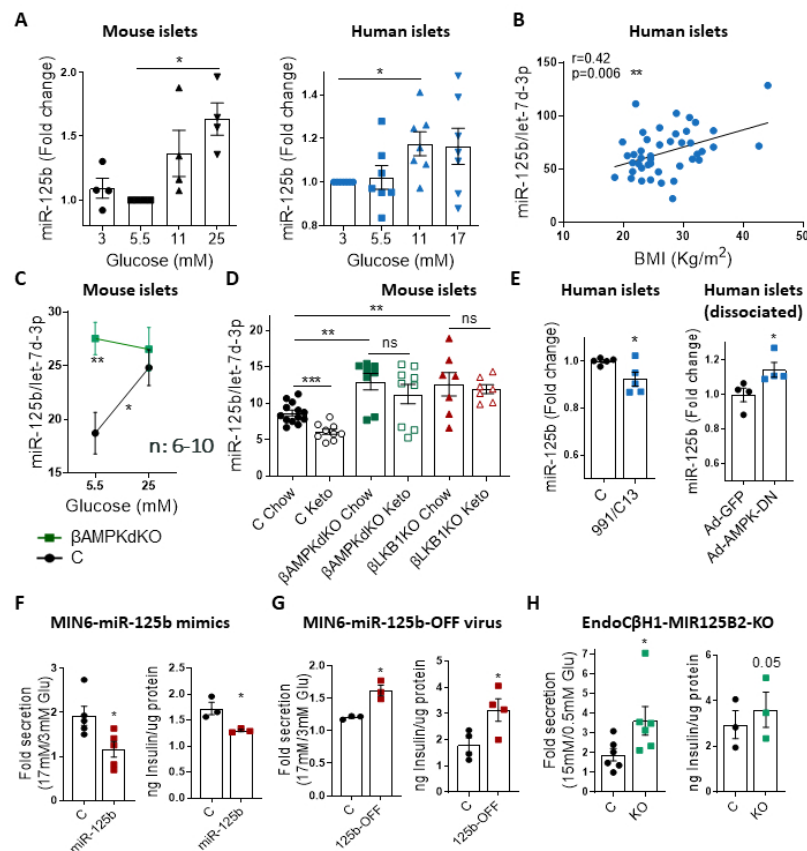

Figure 1. MiR-125b expression is stimulated by glucose via AMPK repression in islets and regulates insulin secretion in insulinoma/β-cell lines. RT-qPCR measurements of A-E, MiR-125b in (A) mouse and human islets cultured at the indicated glucose concentrations for 48h, (B) human islets (from non-diabetic donors) kept for 24h at 5.5mM glucose plotted against donors BMI, (C) islets from βAMPKdKO (green) and control (C, black) mice cultured at 5.5 or 25mM Glucose for 48h, (D) islets from βAMPKdKO (green), βLKB1KO (red) and control (C, black) male and female mice fed a chow or a ketogenic (Keto) diet for 28 days and (E) human islets treated with the AMPK activators C-13 (50nM) and C-991 (20nM) for 18h (left hand-side) and dissociated human islets infected with adenovirus expressing a dominant-negative AMPK protein (Ad-AMPK-DN) or empty control (Ad-GFP) at 5 MOI for 48h (right hand-side panel). Each dot represents islets from a single mouse or human donor. MiR-125b expression is normalized to that of the endogenous control let-7d-3p (4). F-H Glucose-stimulated insulin secretion (GSIS, left hand-side panels) and insulin content (right hand-side panels). GSIS was quantified after 30 minutes of 17 or 15 mM glucose stimulation following overnight preincubation at 3 mM glucose of MIN6 (F, G) and EndoCβ-H1 with CRISPR-mediated miR-125b knockout (H). MIN6 cells were transfected with 5nM miR-125b (125b) or control (C) mimics (F) or infected with adenovirus expressing a miR-125b inhibitor (125b-OFF) or a non-targeting control (C) at 10 MOI (G) 48h before the experiments. Intracellular protein content was quantified by BCA to calculate insulin content per μg of total protein. Data is presented as fold change of basal level. Each dot represents an independent experiment with two-three technical replicates. Experiments were performed with three different populations of CRISPR-mediated miR-125b KO and control cells. Error bars represent SEM. ns=no significant, *p < 0.05, **p < 0.01, ***p < 0.001, one-way ANOVA (repeated measures) and Dunnett multiple comparisons test (A), Pearson Correlation adjusted by age and sex (B), two-way ANOVA (repeated measures) and Bonferroni multiple comparisons test (C), unpaired Welch (D) and paired Student (E-H) t test.

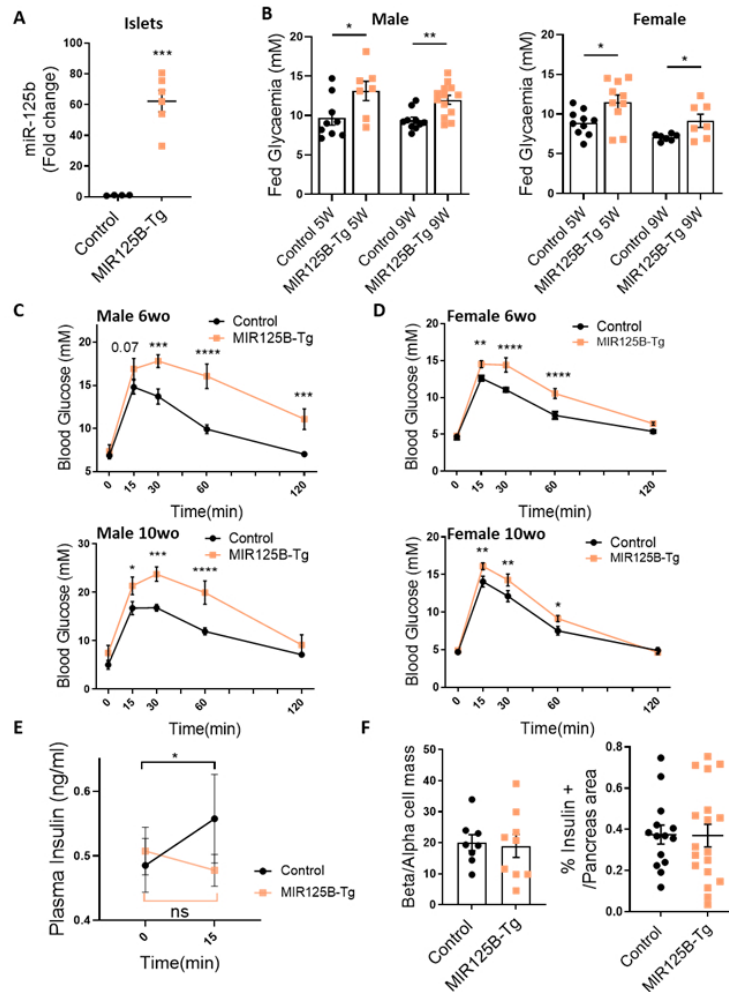

Figure 4. Mice with β -cell-selective overexpression of miR-125b are glucose intolerant and present impaired glucose stimulated insulin secretion. **A**) MiR-125b RT-qPCR in isolated islets from Control (RIP7-rTA^{+/+}) and MIR125B-Tg mice (RIP7-rTA^{+/+}, MIR125B Tg^{+/+}). Data are fold change vs Control. **B**) Glycaemia in 5 and 9 week old Control and MIR125B-Tg mice fed *ad libitum*. For **A** and **B**, each dot represents a single mouse. **C, D**) Glucose tolerance test in 6 and 10 week old MIR125B-Tg and littermate control male (**C**) and female (**D**) mice, n=7-8C, 5-7Tg. **E**) Glucose (3 g/kg)-induced insulin secretion assessed in 10 week old MIR125B-Tg and littermate controls (n=13C, 11 Tg). **F**) Pancreata from MIR125B-Tg and littermate controls were fixed and subjected to immunocytochemical analysis for insulin and glucagon. β - and α -cell masses are presented as the β -cell/ α -cell ratio and correspond to quantification of insulin-positive area/glucagon positive area ratio (left-hand side panel). β -Cell mass is presented as a percentage of the pancreatic surface and corresponds to quantification of the insulin-positive area per pancreas area quantified in whole pancreas sections. Each dot represents one pancreatic section with n = 3 mice/genotype. Error bars represent SEM. *p < 0.05, **p < 0.01, ***p < 0.001, ****p < 0.0001, Welch test (A, B, F); two-way ANOVA (repeated-measures), Fisher least significance different test (C-E).

Figure 4

190x275mm (96 x 96 DPI)

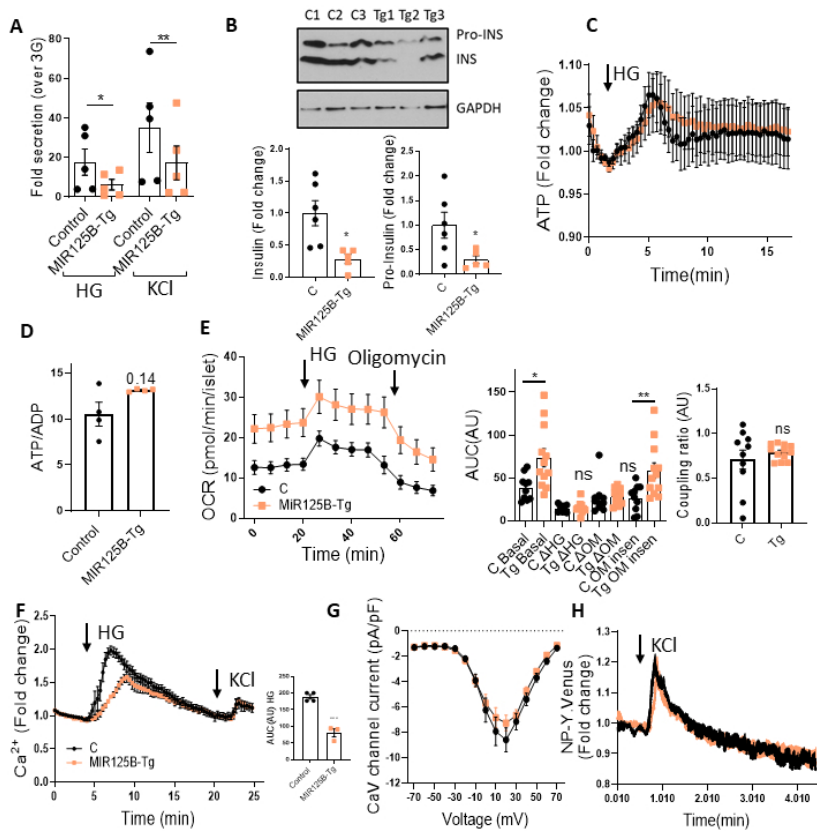

Figure 5. MIR125B-Tg islets contain and secrete less insulin than controls. A) Fold induction insulin secretion vs low glucose (3mM, LG) in response to 30 minutes high (17mM, HG) glucose or KCl (17mM KCl and 3mM Glucose) in islets from 10-11 week old Control (RIP7-rtTA^{+/+}) and MIR125B-Tg (RIP7-rtTA^{+/+}, MIR125B Tg^{+/+}) mice. B) Insulin and pro-insulin content in 10 week old Control (C) and MIR125B-Tg (Tg) mice. A representative WB is shown with islets from 3 C and 3 Tg animals. Bar graphs show densitometry quantification of insulin and pro-insulin, using ImageJ, normalized by GAPDH and presented relative to the average control. C) ATP rises in response to high glucose (17mM vs 3mM) and D) ATP/ADP ratio at 3mM glucose in intact MIR125B-Tg and control islets infected with an adenoviral Perceval sensor, n=4-5 mice/genotype, with 1-2 acquisitions per mouse and an average of 5 islets/acquisition. E) Oxygen consumption rate (OCR) measured in the presence of 3mM or 17mM (HG) glucose and 5μM oligomycin (OM) over time as indicated. Islets were pre-incubated for 1h at 3mM glucose. Left hand-side panel shows traces from the actual experiment. Middle and right hand-side panels show calculations during the indicated periods. "Basal" shows AUC under basal (3mM) conditions, ΔHG and -ΔOM report the change in respiration when 17mM Glucose and oligomycin are added, respectively. The oligomycin insensitive value (OM insen) reports the residual respiration after the addition of oligomycin and coupling ratio (right-hand side panel) represents the oligomycin-sensitive respiration divided by respiration preceding oligomycin. Each dot represents a plate well with 3-6 size-matched islets (n=10-12) extracted from 3 Control (C) and 4 MIR125B-Tg (Tg) mice. F) Ca²⁺ rises in response to high glucose (17mM vs 3mM) and KCl (20mM KCl, 3mM Glucose) in intact MIR125B-Tg and control islets incubated with Cal-520, n=4-5 mice/genotype, with 1-2 acquisitions per mouse and an average of 5 islets/acquisition. AUC corresponding to HG incubation was determined and presented on the right. G) Average maximum Ca_V current densities recorded from control and MIR125B-Tg β-cells in response to 10 mV steps from -70 to 70mV, N= 16 and 29 β-cells from 2 control and 4 MIR125B-Tg mice. H) NP-Y-Venus fluorescence increases in response to 20mM KCl in cells from dissociated MIR125B-Tg and control islets infected with an adenoviral NP-Y-venus sensor, n=3-4C mice/genotype 2th 2 acquisitions per mouse and 1-2 β-cells per acquisition. Each dot represents a single mouse in all graphs unless otherwise indicated. Error bars represent SEM. ns=not significant *p <0.05, **p <0.01, ***p < 0.001, two-way ANOVA (repeated-measures) and Bonferroni multiple comparisons test (A), paired Student (B) and unpaired Welch (D-E) or Student t test (F).

ONLINE SUPPLEMENTAL MATERIALS

SUPPLEMENTAL FIGURE LEGENDS

Supplemental Figure 1. Human islet miR-125b expression correlates with donor BMI but not with age or sex of the donors.

RT-qPCR measurements of **(A)** human islets cultured at the indicated glucose concentrations for 48h and **(B)** human islets cultured at 5.5mM glucose plotted against islet donor BMI. MiR-125b expression is normalized to that of the endogenous control miR-574-3p. **(C)** RT-qPCR measurements of miR-125b human islets cultured at 5.5mM glucose plotted against islet donor age (left hand-side panel) or sex (right hand-side panel). MiR-125b expression is normalized to that of the endogenous control miR-7d-3p. RT-qPCR measurements of **(D)** islets from β AMPKdKO (green), β LKB1KO (red) and control (C, black) male and female mice fed a chow or a ketogenic (Keto) diet for 28 days and **(E)** human islets treated with the AMPK activators C-13 (50nM) and C-991 (20nM) for 16h (left hand-side) and dissociated human islets infected with adenovirus expressing a dominant-negative AMPK protein (Ad-AMPK-DN) or empty control (Ad-GFP) at 5 MOI for 48h. MiR-125b expression is normalized to that of the endogenous control miR-574-3p. Each dot represents islets from a single mouse or human donor. Error bars represent SEM. $*p < 0.05$, $**p < 0.01$, $***p < 0.001$, one-way ANOVA (repeated measures) and Dunnet multiple comparisons test (A), Pearson Correlation adjusted by age and sex (B), Pearson Correlation (C), two-way ANOVA (repeated measures) and Bonferroni multiple comparisons test (D), and paired Student *t* test (E).

Supplemental Figure 2. MiR-125b regulates insulin secretion in insulinoma/ β -cell lines.

A) MiR-125b RT-qPCR in MIN6 cells transfected with 5nM miR-125b or control (C) mimics. Each dot represents an independent experiment. MiR-125b expression is normalized to that of the endogenous control miR-574-3p and presented as fold change of control-transfected cells. **B-D)** Glucose-stimulated insulin secretion presented as % of secreted insulin from total content and quantified after 30 minutes of 17 or 15 mM glucose stimulation following overnight

preincubation at 3 mM glucose of MIN6 (**B**, **C**) and EndoC β -H1 with CRISPR-mediated miR-125b knockout (**D**). MIN6 cells were transfected with 5nM miR-125b (125b) or control (C) mimics (**B**) or infected with adenovirus expressing a miR-125b inhibitor (125b-OFF) or a non-targeting control (C) at 10 MOI (**C**) 48h before the experiments. Each dot represents an independent experiment. Error bars represent SEM. ns=no significant, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, paired Student t test (A) and two-way ANOVA (repeated measures) and Sidak multiple comparisons test (B-D)

Supplemental Figure 3. Elimination of miR-125b by CRISPR-Cas9 in EndoC β -H1 cells.

A) Schematic representation of the targeting location of the gRNAs in *MIR125B-1* and *MIR125B-2* human loci. Two independent pairs of gRNAs were designed for each loci, targeting the seed of miR-125b (miR-125b-5p) or the regions essential for DROSHA and/or DICER cleavage. **B)** RT-qPCR measurements of (mature) miR-125b in Control EndoC β -H1 (containing the RIP-Cas9 vector, but no gRNAs), MIR125B1-KO1 and MIR125B1-KO2 (containing RIP-Cas9 vector with gRNAs targeting the *MIR125B1* locus, pair 1 (KO1) or pair 2(KO2)), MIR125B2-KO1 and MIR125B2-KO2 (containing RIP-Cas9 vector with gRNAs targeting the *MIR125B2* locus, pair 1 (KO1) or pair 2(KO2)) or combinations of the above gRNAs as indicated. **C)** RT-qPCR of miR-99a and miR-125a in Control (C) and MIR125B2-KO1 (KO) cells demonstrating that elimination of miR-125b using gRNAs targeting the *MIR125B2* locus does not result in reduction of the clustered miRNA miR-99a or in compensatory overexpression of the family member miR-125a. Values were normalized by the endogenous control let-7d-3p and are presented as fold change relative to control cells. Control (C) and MIR125B2-KO1 (KO) cells were **(D)** stained with Annexin V-FITC and propidium iodide (Abcam) and subjected to flow cytometry to determine the percentage of alive cells (Annexin V and PI negative cells) and **(E)** submitted to an MTT assay to determine cellular metabolic activity as absorbance values at 550-690 (Optical density). Each dot represents an independent experiment. ns=not significant, ** $p < 0.01$, *** $p < 0.001$, *** $p < 0.0001$, paired Student t test (D) of the log[fold change] values (B, C)

Supplemental Figure 4. Experimental design and validation for the high-through identification of miR-125b target genes. **A)** Schematic overview of the steps of the experimental approach used for the identification of miR-125b targets. MIN6 cells were transfected with 5nM control of miR-125b mimics for 24h. Then, total RNA was extracted, poly(A)-enriched and prepared for sequencing (n=5, T-RNA) or RNAs present in miRISC complexes were immunoprecipitated with anti AGO2-antibodies and submitted to RNA-seq (n=5, RIP-RNA). Differential analysis of gene expression was performed for both datasets separately generating fold change gene expression (miR-125b vs control) for all genes detected. Then both lists were combined to generate a ratio of Immunoprecipitated vs Total (poly(A) RNA). **B)** Enrichment of miR-125b seed sites in the 3'UTRs (left hand-side panel) and CDSs (right hand-side panel) of the mRNAs ranked according to RIP-RNA/T-RNA. The scatter plot shows the maxima of enrichment profile. Each dot represents a 7-letter word. The Y-position shows the maximum score of an enriched word and the X-position shows the gene-index where the Z-score is maximum. Top-ranked words with a left-shift associate with gene-expression change (lower gene index represents a stronger upregulation in RIP-RNA/T-RNA upon miR-125b transfection). The sequence of mature miR-125b is shown on the right, with the seed region in red. The reverse complementary sequence (RC) is also shown in red.

Supplemental Figure 5. MiR-125b alters mitochondria morphology and genes associated with mitochondrial function. **A, B)** Quantitative analysis of mitochondria number and morphology on deconvoluted confocal images of (A) MIN6 cells transfected with miR-125b (red) or control (black) mimics or (B) EndoCβ-H1 with CRISPR/Cas9-mediated miR-125b deletion (green) or controls (black). Cells were stained with Mitotracker green. An ImageJ macro was generated and used to quantify number of mitochondria per cell, total mitochondria area and individual mitochondria perimeter. Each dot represents one acquisition (n=3 (b), n=4 (c) independent experiments). Error bars represent SEM. **p<0.01, ****p<0.0001, upaired Student t test. **C)** Gene Ontology analysis of dysregulated genes in EndoCβ-H1-MIR125B2-KO vs controls (609 and 81 genes up- and down-regulated, respectively, padj<0.1) performed

with DAVID. The graph shows enrichment scores for one representative term for each cluster grouped by semantic similarities and including terms with $\text{padj (Benjamini)} < 0.05$. See Supp Table 4 for a full list of terms.

Supplemental Figure 6. β -cell-selective overexpression of miR-125b does not alter hypothalamic miR-125b expression, body weight, insulin tolerance and β -cell growth and apoptosis.

A) RT-qPCR of miR-125b in hypothalamus from Control (RIP7-rtTA^{+/+}) and MIR125B-Tg mice (RIP7-rtTA^{+/+}, MIR125B Tg^{+/+}). **B)** Body weight of male and female MIR125B-Tg and littermate control mice monitored weekly from the age of 5 weeks. $n=5-8$ mice/genotype. **C)** Glucose tolerance test in 6 week old mice containing the transgene in the absence of rtTA (-rtTA Control, MIR125B Tg^{+/+}) and littermate controls without the transgene or rtTA, showing that the presence of the transgene doesn't affect glucose tolerance. $n=4-6$ mice/genotype. **D)** Intraperitoneal Insulin tolerance test in 7 week old MIR125B-Tg and littermate control male and female mice. $n=5-8$ mice/genotype. **E,F)** Pancreata from 11 week-old MIR125B-Tg and littermate controls were fixed and subjected to (E) immunocytochemical analysis for insulin and Ki67. The number of Ki67-positive cells is expressed as a percentage of insulin-positive cells (F) TUNEL assay for *in situ* detection of apoptotic cells. The number of TUNEL-positive cells is presented as a percentage of insulin-positive cells. Each dot represents one pancreatic section with $n=3$ mice/genotype. **G)** Insulin secretion in response to 30 minutes low (3mM, LG), high (17mM, HG) glucose or KCl (17mM KCl and 3mM Glucose) in islets from 10-11 week old Control (RIP7-rtTA^{+/+}) and MIR125B-Tg (RIP7-rtTA^{+/+}, MIR125B Tg^{+/+}) mice (left hand-side panel). Insulin and pro-insulin/insulin content in 10 week old Control (C) and MIR125B-Tg (Tg) mice quantified by HTRF (**H**) and Western blot (**I**), respectively. (**I**) shows densitometry quantification using ImageJ of the experiments presented in Figure 5, normalized by GAPDH and presented relative to the average control. **J)** Total pancreatic insulin content quantified using HTRF and presented as relative to total protein from whole pancreata of Control and MIR125B-Tg mice. **K)** Quantitative analysis of lysosomes number and total area on deconvoluted confocal images of dissociated MIR125B-Tg and Control islets

from 10-11 week old mice. Cells were stained with LysoTracker green. An ImageJ macro was generated and used to quantify number of lysosomes per cell and total lysosomal area. Each dot represents one cell (n=3 mice/genotype). ns=not significant, * $p < 0.05$, *** $p < 0.001$, **** $p < 0.0001$, unpaired Student t test (A, E-F, I-K), paired Student t test (H) two-way ANOVA (repeated-measures), Fisher least significance different test (C-D), Bonferroni multiple comparisons test (G).

Supplemental Figure 7. Molecular and Cellular pathways altered in MIR125B-Tg mice.

Heatmaps of significantly downregulated (A) and upregulated genes (B) associated to selected cellular pathways and functions enriched in MIR125B-Tg islets following Gene Ontology analysis. Colour intensity shows magnitude of fold change. For phosphoproteins and glycoproteins, only the ~80 most up-regulated genes are displayed due to space limitations. Please see supplemental table 8 for a comprehensive list of genes.

Supplemental Figure 8. Overexpression of miR-125b in human islets. **A**, RT-qPCR of miR-125b in full human islets 48h following infection with 5 MOI of an adenovirus expressing miR-125b (pAd-MIR125B) or control (pAd-empty). Each dot represents an independent experiment with islets from different human donors **B**) Glucose-stimulated insulin secretion quantified after 30 minutes of 15 mM glucose stimulation following 1h pre-incubation at 3 mM glucose of human islets infected Ad-MIR125B or a non-targeting control (C) at 5 MOI 48h before the experiments. Each dot represents an independent experiment performed with islets from two different donors. **C**) RT-qPCR of miR-125b in dissociated human islets 24h following infection with 2 MOI of an adenovirus expressing miR-125b (pAd-MIR125B) or control (pAd-empty). Each dot represents an independent experiment with islets from different human donors **D**) Principal Component Analysis of the RNA-seq data in human dissociated islets infected with pAd-MIR125B or control (C) adenovirus. HI=Human islets. 3 independent experiments were performed with islets from three different donors (H1-3). **E**) Gene Set Enrichment Analysis (GSEA) of genes ranked by fold change in human islets infected with an adenovirus expressing miR-125 vs control during 24h. The graph shows enrichment scores

for significantly ($p < 0.05$) down- (red, top plot) and up-regulated (green, bottom plot) KEGG pathways terms. See Supp Table 8 for a full list of terms. Examples of enrichment plots (Lysosome and calcium signalling KEGG pathways) are shown in E. $**p < 0.001$, $***p < 0.0001$, $****p < 0.00001$, paired Student t test of the log[fold change] values (A, C), two-way ANOVA (repeated-measures), Bonferroni multiple comparisons test (B).

SUPPLEMENTAL RESEARCH DESIGN AND METHODS

Cells and islets culture

MIN6 cells were cultured in 4.5 g/L glucose Dulbecco's modified Eagle's medium (DMEM) containing 15% FBS, 2mM L-glutamine, 20nM HEPES and 50 μ M β -mercaptoethanol. EndoC- β H1 cells were cultured in 1g/L glucose DMEM supplemented with 2% Bovine Serum Albumin Fraction V, Fatty Acids Free, 10mM nicotinamide, 5.5 μ g/ml transferrin 6.7 ng/ml sodium selenite and 50 μ M 2-mercaptoethanol(2). Mouse pancreatic islets were isolated with collagenase as described previously (3) and allowed for recovery from digestion overnight in culture medium (RPMI 1640, 10% FBS, L-glutamine and 11mM glucose) or directly used for experiments. Human islets were cultured in RPMI 1640, 10% FBS, L-glutamine and 5.5 mM glucose. The characteristics of the human donors are shown in Sup Table 9. Cells and islets were maintained at 37°C with 95% O₂/ 5% CO₂. AMPK activation was performed with 20 mM compound 13 (C13)(4) and 50 mM compound 991(5) as indicated in the figure legends.

Plasmids generation

To generate adenovirus expressing miR-125b, a 426-nucleotide sequence containing pre-miR-125b was amplified by PCR from C57BL6/J mice genomic DNA with the primers 5'-AGGGAGCCAGGATGTAGTCA-3' and 5'-CGGGTCACCTGATCCCATCTA-3' and subcloned into pAdTrackCMV (pAd-MIR125B). Adenovirus were then generated using the AdEasy system(6). Adenovirus containing the empty vector were used as controls.

As above, the PCR-amplified pre-miR-125b-containing region was subcloned into pBI-LTet to generate pBI-LTet-MIR125B.

For reporter assays, full length *Taz*, *M6pr*, *Tor2a1*, *Mtfp1* and *Gnpat* 3'UTRs and *Tnksbp1* and *Gnpat* CDS were amplified by PCR from MIN6 cDNA and subcloned into pmirGLO (Promega), downstream the *Firefly* ORF. MiR-125b binding sites in *M6pr* and *Mtfp1* were identified with TargetScan(7) and three and two point mutations were introduced, respectively, in the sequences complementary to the miR-125b seed using site directed mutagenesis with the primers (mutated nts in bold): *M6pr*: 5'-CTCTCCTGCTGGCT**ACT**GGAAGTGTCTGACCC-3' and 5'-GGGTCAGACACTTCC**AGT**AGCCAGCAGGAGAG-3'; *Mtfp1*: 5'-GTATTTGGGACACTCT**AGGC**AGAGTCTCTGG-3' and 5'-CCAGAGACTCTGCCT**AGAG**TGTCCCAAATAC-3'.

All the constructs were verified by sequencing.

Transfection of miRNA mimics, siRNAs and plasmidic DNA

Cells were transfected at 60-80% confluence with 5 nM/1nM (MIN6, EndoC β -H1, respectively) control or miR-125b mimics (Qiagen) or 50 nM of a mixture of four ONTARGETplus siRNAs against mouse Smad2, Smad3 or non-targeting (Horizon Discovery) as previously described(8; 9). For luciferase assays MIN6 cells were plated at ~70% confluency in 48-well plates, and, the following day, transfected with 0.4 μ l Lipofectamine 2000(ThermoFisher Scientific), 5ng plasmid and 5nM control or miR-125b mimics. After 24 h, cells were lysed and luciferase activity determined with the Dual-Glo luciferase assay system (Promega, UK), following the manufacturer's instructions.

CRISPR-Cas9-mediated deletion of miR-125b in EndoC β -H1 cells

MIR125B-1 and *MIR125B-2* sequences were downloaded from miRBase(10). Using the website tool available at <http://crispr.mit.edu/>, we designed two independent pair of gRNAs targeting the seed region of the mature miR-125b and/or the regions in the pri/pre-miR-125b essential for DROSHA and/or DICER processing (Supplemental figure 2) as in(11). Two different gRNA pairs targeting each locus were subcloned under an H1 and U6 promoter within a lentiviral vector in which hSpCas9 expression is driven by a RIP (rat *Insulin* promoter) using

the cloning strategy described in Beucher and Cebola in Nature Protocol exchange (<https://protocolexchange.researchsquare.com/article/nprot-7395>). EndoC β -H1 cells were transfected with lentivirus expressing these gRNAs and the hSpCas9 and integrating cells were selected by subculture in the presence of 4 μ g/ml puromycin, encoded by the vector. Cells infected with lentiviral vectors containing the RIP-hSpCas9 cassette but without gRNAs were used as control. RT-qPCR for mature miR-125b was performed to assess the levels of the mature miR-125b in the resultant cell populations. All the experiments were performed with controls and KO cell populations generated from at least three independent infections.

Cell viability of EndoC β -H1-MIR125B2-KO and control cells was determined by double staining with Annexin V-FITC (1:500 dilution, Abcam) and 100 μ g/ml propidium iodide (Abcam) using a Bd LSR II flow cytometer at LMS/NIHR Imperial Biomedical Research Centre Flow Cytometry Facility. Cell proliferation was assessed with a Cell Proliferation Kit I (MTT) (Roche) according to manufacturer's instructions in cells cultured in 96-well plates for 72h.

RNA extraction, reverse transcription (RT) and qPCR

Total RNA was extracted using Trizol (Thermofisher) following manufacturer's instructions. RT-qPCR was performed as previously described(8) with miRCURY LNA RT and SYBR Green PCR miRNA kits and miRCURY LNA probes for miRNAs (Qiagen) and High-capacity cDNA transcription kit and Fast SYBR Green (Qiagen) for mRNA and pri-miRNAs. For the latter, an anchored oligo dT primer was used in the RT reaction. MiR-7d-3p and miR-573-3p were used as endogenous controls due to their high stability in our system(8).

MiRISC immunoprecipitation.

MiRISC-immunoprecipitation was performed as previously described(12). Briefly, MIN6 cells were seeded in 15 cm dishes and transfected with 5 nM of control or miR-125b mimic for 24 h. Following transfection cells were washed in cold PBS, scraped in PBS and collected by centrifugation. Pellets were then resuspended in 500 μ l of lysis buffer (20mM Tris-HCl pH7.5, 150mM KCl, 0.5% NP40, 2mM EDTA, 1 mM NaF and 160 U ml⁻¹ RNasin and protease

inhibitors) and pre-cleared with Dynabeads Protein G beads (Thermo Fisher Scientific) for 2 h at 4°C. Precleared extract was incubated with Dynabeads Protein G beads conjugated with 6µg of mouse-anti-AGO2 (clone E12-1C9, Abnova) or mouse IgG (NXA931, Merck) and 1mg/ml of heparin for at 4 C for 16 hours with end-over-end rotation. After washing, the beads-immunoprecipitate were treated with TURBO™ DNase (2 U/µL) (Thermo Fisher Scientific) and proteinase K (20mg/ml) (Thermo Fisher Scientific) for 20 min at room temperature. RNA was extracted using phenol/ chloroform and ethanol/sodium acetate precipitation.

RNA sequencing library preparation, sequencing and analysis

Quantity and integrity of total RNA from MIN6, EndoCβ-H1 and mouse islets was determined with an Agilent Bioanalyzer and mRNA enriched was performed from 500-1000ng of RNA using a NEBNext Poly(A) mRNA Magnetic Isolation Kit (NEB). Library preparation from mRNA and from miRISC-isolated RNA was performed using a NEBNext Ultra II Directional RNA Library Prep Kit for Illumina (NEB) and Universal i5 and i7 primers following manufacturer's instructions. Library preparation from human islets total RNA (200ng) was performed using a NEBNext Low Input RNA Library Prep kit (NEB). Sequencing was performed on a HiSeq4000 using 75 bp paired end reads according to Illumina specifications. For total mRNA ~25-40 million reads/sample and for miRISC RNA~12 million reads/sample were obtained. FastQC (<http://www.bioinformatics.babraham.ac.uk/projects/fastqc/>) was used to assess the quality of the reads obtained and reads were then mapped to the mouse or human transcriptome (GRCm38 and GRCh37, respectively) using Salmon v1.3.0(13). Differential expression analysis was performed with the R package DESeq2(14).

For miRNA target identification, Total mRNA (T-RNA) and immunoprecipitated RNA (RIP-RNA) samples were treated as separate datasets and the two resulting gene lists of differential analysis were used to calculate the ratio of immunoprecipitated RNA to total mRNA (IP-RNA/T-RNA) for each gene detected in both datasets. Genes were ranked by RIP-RNA/T-RNA ratio and subjected to motif discovery and enrichment analysis in their 3'UTRs and CDS with cWords(15). Cytoscape(16) was used to visualize genes with RIP-RNA/T-RNA >1.5

(arbitrary cut-off). Gene set enrichment analysis (GSEA) was performed for genes with a baseMean (average of the normalized count values) > 10 ranked by fold change in gene expression in human islets infected with pAd-MIR125B or pAd-empty (Control) virus against the curated KEGG gene sets collection from MSigDB (Molecular Signature Database). DAVID(17) was used for Gene Ontology enrichment analysis of genes differentially dysregulated ($p_{adj} < 0.1$) in MIR125B-Tg islets, EndoC β -H1 MIR125B2-KO and in MIN6 cells overexpressing miR-125b.

Immunoblot and Immunohistochemistry

For Western blotting, EndoC β -H1 cells, dissociated human islets and whole mouse islets lysates were prepared in RIPA buffer. 5-15 μ g of EndoC β -H1 total protein extract, ~20000 human islet cells extract or 10-20 islets extract was submitted to SDS-PAGE and transferred to 0.2 μ M PVDF membranes. Membranes were incubated overnight with anti-M6PR (sc-365196 Santa Cruz Biotechnology) or anti-Insulin (L6B10, Cell Signalling Technology).

Slides for immunohistochemistry were prepared from isolated pancreata and visualized as previously detailed(18). For β -cell mass and proliferation measurements, slides were blotted with the following primary antibodies: anti-insulin (IR00261-2, 1:4; Agilent Technologies) and anti- glucagon (g2654, 1:100; Sigma) and/or anti-Ki67 (ab15580, 1:100 Abcam) antibodies and mounted using DAPI-containing Prolong Diamond (Life Technologies). To quantify apoptosis, pancreatic sections were submitted to terminal deoxynucleotidyl transferase dUTP nick-end labeling (TUNEL) assay using a DeadEnd Fluorometric TUNEL system kit (Promega) according to the manufacturer's instructions. Slides were visualized with an Axiovert 200M microscope (Zeiss). ImageJ software was used to quantify the area positively stained for insulin and glucagon and the number of Insulin-, Ki67-, TUNEL- and DAPI-positive cells of all visible islets. For β -cell mass we calculated the percentage of pancreatic surface that was positive, as measured in whole pancreas sections separated by at least 25 μ m in the z-axis. For β -to- α cell mass we calculated the ratio of insulin to glucagon positive area in all visible islets.

Islets for immunohistochemistry were fixed in 4% PFA and stained with anti-cathepsin (ab75852, 1:200 Abcam) and anti-LAMP1 (1D4B, 1:100 University of Iowa DSHB) antibodies. Islets were visualized with a LSM780 inverted confocal microscope (Carl Zeiss, Cambridge, UK) using a $\times 63$ 1.4 numerical aperture (NA) oil objective. Five to seven images at different z planes of the islet (top, middle, bottom) were acquired per islet. Z-stacks were prepared from this images in ImageJ and quantifications of the particles with positive staining for cathepsin D, LAMP1 or both, were performed in 3-10 individual cells per islet.

Islet fluorescence imaging

For Ca^{2+} Imaging, whole isolated islets were incubated with Cal-520 (4.5 μM ; Stratech) for 45 min at 37 °C in KRBH containing 3mM glucose. For ATP imaging, 48 hours prior to experiment, islets were infected with an adenovirus containing encoding the ATP sensor Perceval(19). Islets were incubated in KRBH buffer supplemented with 3mM glucose for 45 minutes before imaging. Excitation of the probes was achieved using 491nm and emitted light was filtered at 525nm. Islets were kept at 37°C and constantly perfused with KRBH B containing 3mM or 17mM glucose or 20mM KCl. Fluorescence live imaging was performed using a Nipkow spinning disk head and Velocity software (PerkinElmer). Data were analyzed with ImageJ software using an in-house-made macro, available upon request. For ATP/ADP ratio, the same probe and samples were used but the imaging was performed only at 3mM glucose with excitation at 491 and 405 nm to obtain ratiometric signal.

For TIRF experiments, mouse islet were infected with an adenovirus construct for NPY-venus 48 hour prior to the experiments. Before imaging, islets were dissociated using accutase, pelleted, resuspended in normal culture media and left to attach on a glass slide treated with polylysine. After incubation in KRBH buffer containing 3 mM glucose, slide was mounted in an imaging chamber. Imaging of cells expressing NPY-venus in the secreting vesicle was performed as described previously(20) using a Nikon Eclipse Ti microscope equipped with a $\times 100/1.49$ numerical aperture (NA) TIRF objective, a TIRF iLas2 module to control laser angle (Roper Scientific), and a Quad Band TIRF filter cube (TRF89902, Chroma). Acquisitions were

performed using a 488-nm laser line, and images were captured with an ORCA-Flash 4.0 camera (Hamamatsu). Metamorph software (Molecular Devices) was used for data capture, acquisition speed was set at 3Hz and the laser angle was selected for an imaged section thickness at the cell membrane of 150–180 nm. KCl at 20mM was used to stimulate insulin secretion and added to the well during acquisition after 3 minutes in KRBH 3 mM Glucose. Image analysis was performed using ImageJ to measure mean fluorescence intensity at the cell membrane over time.

For mitochondria morphology analysis MIN6 and EndoC β -H1 cells and dissociated mouse islets cultured in coverslips were pre-incubated for 45 minutes in KRBH solution supplemented with 25, 5 or 11 mM glucose, respectively, and Mitotracker Green™ (100nM for MIN6 and islets, 70nM for EndoC β -H1; ThermoFisher) in a 37°C humidified incubator with 95% O₂/5% CO₂. Mitotracker green was washed with KRBH buffer before imaging. Cell images were acquired with a 60x oil immersion objective lens (Olympus) in a Nikon ECLIPSE Ti microscope. Dissociated islets were imaged on a LSM780 inverted confocal microscope (Carl Zeiss, Cambridge, UK) using a $\times 63$ 1.4 numerical aperture (NA) oil objective. Two to three randomly selected fields of view were taken per acquisition, containing 5-15 MIN6/EndoC β -H1 cells or a single dissociated mouse β -cell. Images were deconvoluted using Huygens software (Scientific Volume Imaging). Mitochondria morphological characteristics (i.e. number, area, elongation, circularity and perimeter) were quantified with ImageJ using an in-house macro (available upon request) as described by Wiemerslage et al (21). Quantifications were performed in z-stacks of 10 images for EndoC- β H1 and MIN6 cells and in three stacks of three images each at the top, middle and bottom of the primary β -cells.

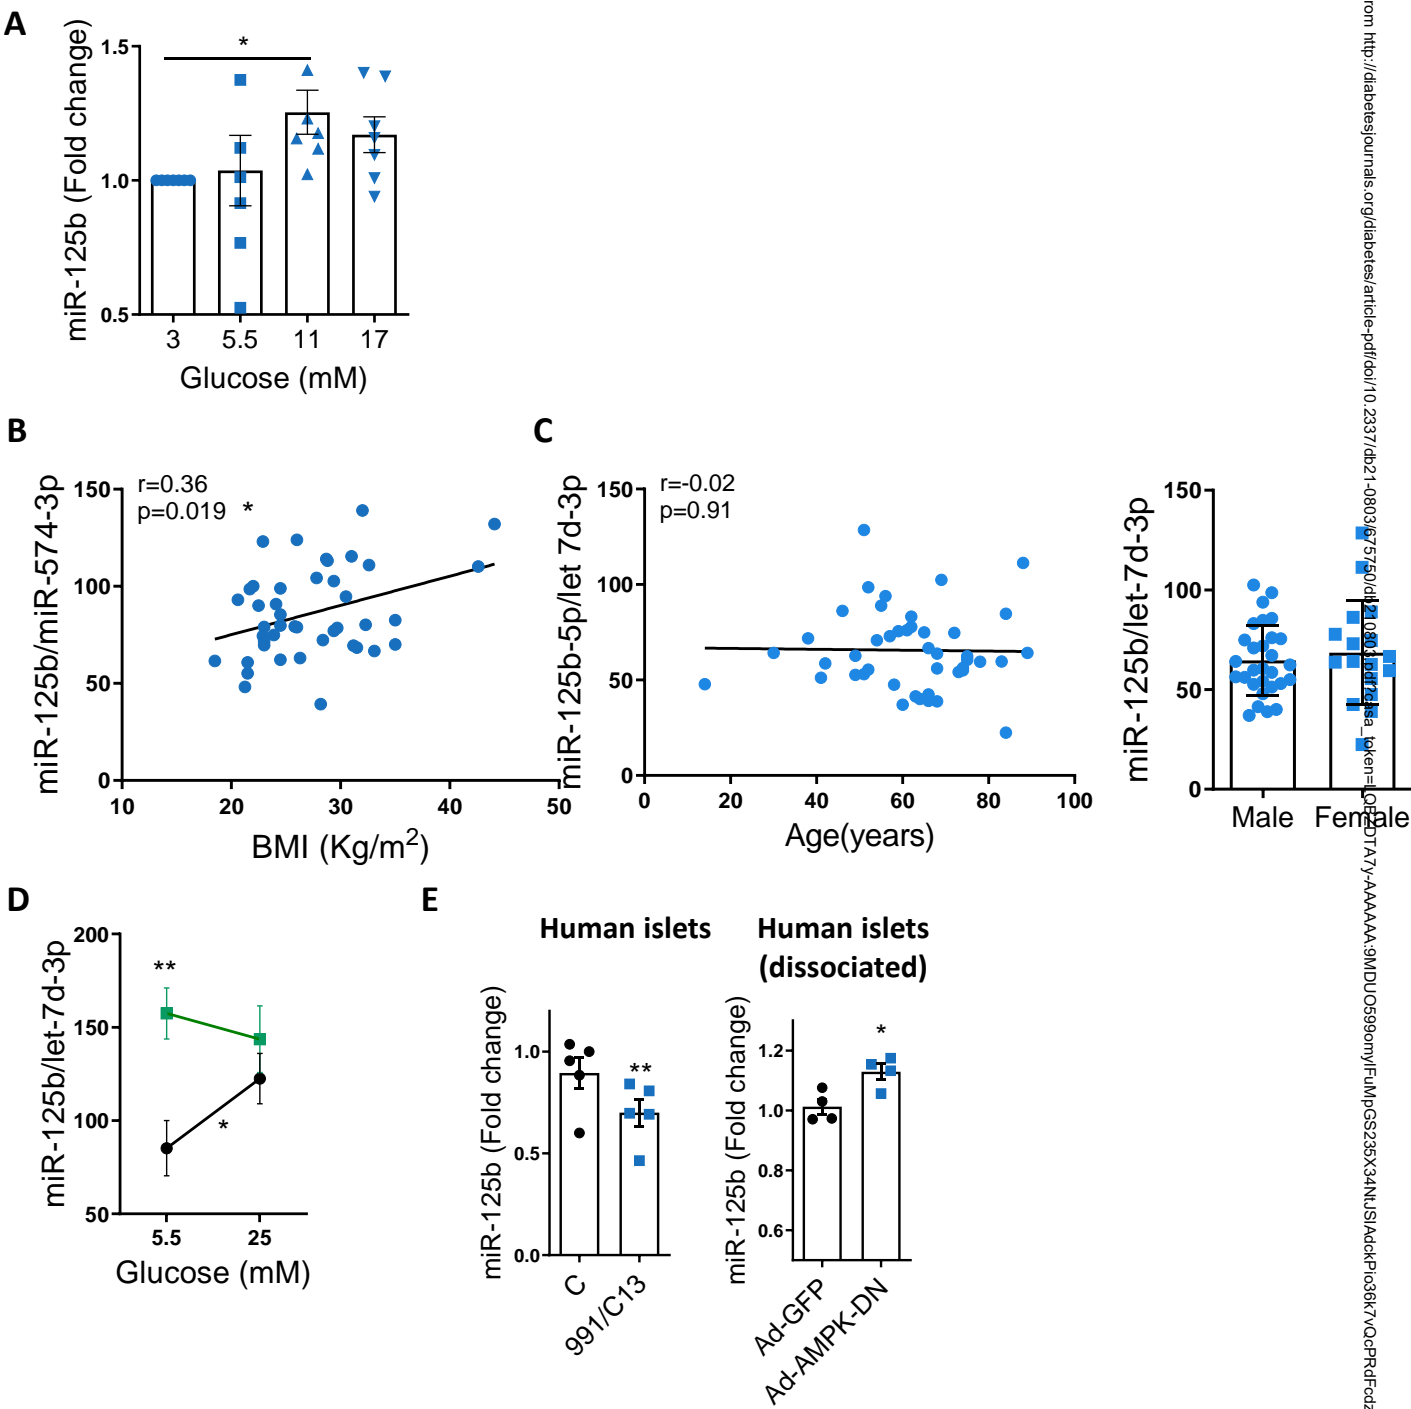

Whole-cell voltage-clamp electrophysiology

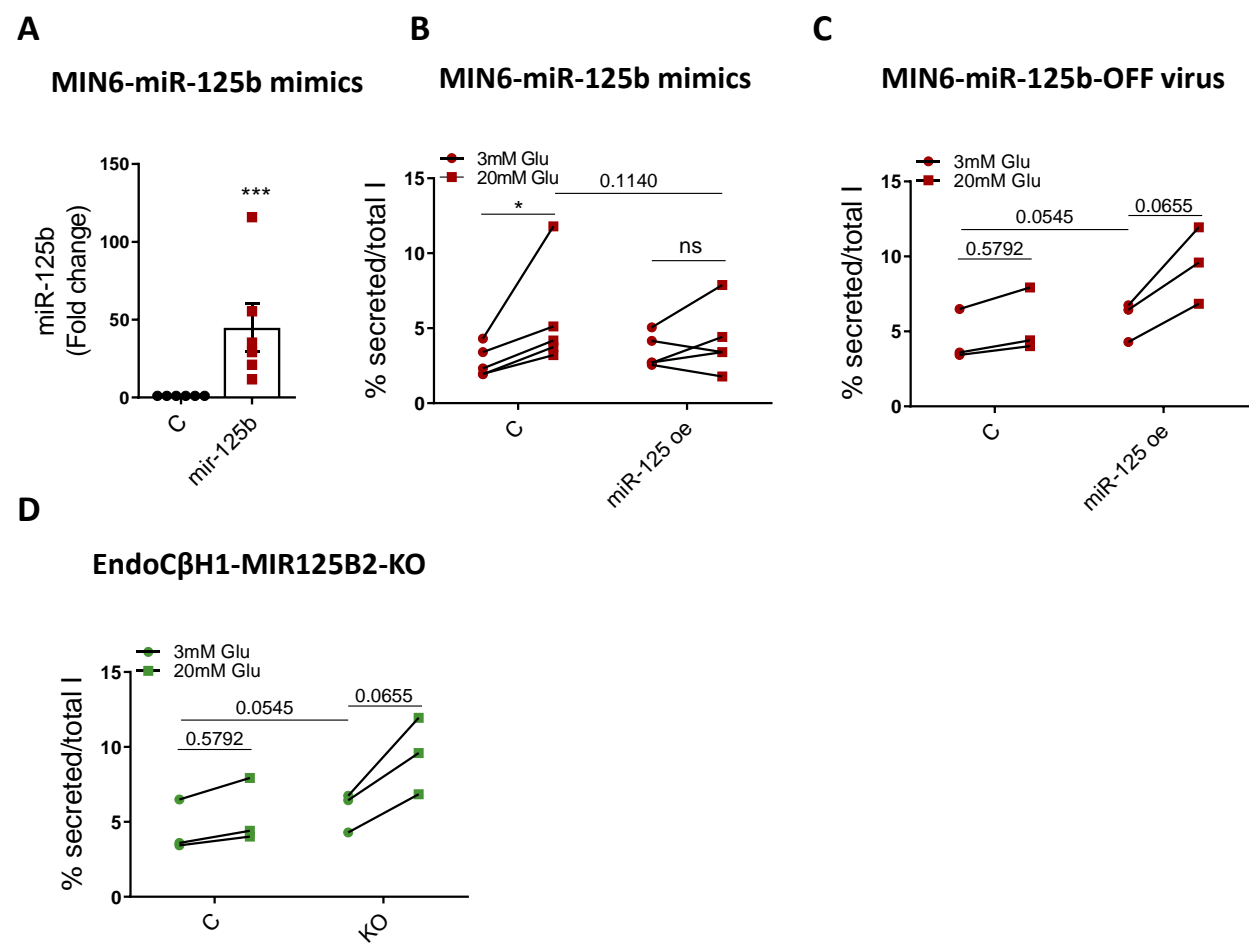

Control and MIR125B-Tg islets were dispersed into single cells by gently titration for 30 seconds in TrypLE™ Express (Thermo Fisher) and cultured overnight in RPMI-1640 medium (RPMI) with 5.6 mM glucose supplemented with 15% fetal bovine serum (FBS), 100 IU·ml⁻¹ penicillin, and 100 mg·ml⁻¹ streptomycin at 37°C, 5% CO₂. Patch electrodes (3-4 M Ω) were

backfilled with intracellular solution containing (mM) 102.0 CsCl, 10.0 TEA-Cl, 10.0 EGTA, 3.0 Na₂ATP, and 5.0 HEPES (pH 7.25 adjusted by CsOH). Voltage-clamp electrophysiology was performed on β -cells in extracellular buffer containing (mM) 119.0 NaCl, 4.7 KCl, 2.0 CaCl₂, 1.2 MgSO₄, 1.2 KH₂PO₄, 10.0 HEPES, and 17.0 glucose (pH 7.35 adjusted by NaOH). After forming a tight seal between the patch pipette and β -cell (seal resistance > 1 G Ω), whole-cell access was established and the bath solution was exchanged (3 minutes; 2 mL/minute flowrate) with extracellular buffer containing (mM) 82.0 NaCl, 5.0 CsCl, 30.0 CaCl₂, 1.0 MgCl, 0.1 EGTA, 20.0 TEA-Cl, 0.1 tolbutamide, and 17.0 glucose (pH 7.35 with NaOH). Starting from a holding potential of -80 mV, voltage-dependent Ca²⁺ (Ca_v) channel currents were generated through application of sequential 10 mV depolarizing steps ranging from -70 to +70 mV (500 ms); membrane potential was held at -80 mV for 7.5 seconds between each voltage step. Linear leak currents were subtracted using a P/4 protocol. Ca_v currents were normalized to cell capacitance and normalized peak Ca_v currents plotted as a function of applied voltage.
