# A New Preconditioner on Gauss-Seidel Method for $H$ -Matrices

M. T. Darvishi and M. Azimbeigi

Department of Mathematics, Razi University, Kermanshah 67149, Iran

**Abstract.** In order to accelerate the convergency of Gauss-Seidel method to solve systems of linear equations when the coefficient matrix is an  $H$ -matrix, a new preconditioner is introduced. The convergency of the new preconditioned method is proved.

**Keywords:** Gauss-Seidel method; Preconditioning;  $H$ -matrix;  $H$ -splitting

**PACS:** 02.60.Dc

## INTRODUCTION

Consider the following system:

$$Ax = b, \quad x, b \in \mathbb{R}^n, \quad (1)$$

where  $A \in \mathbb{R}^{n \times n}$  is a nonsingular matrix. To accelerate convergency of iterative methods to solve (1), the preconditioned methods are often used. Evans et al. [1] presented a preconditioner and improved the convergency rate of AOR iteration method for the original linear system (1) when  $A$  is an  $L$ -matrix. They showed that, under certain assumptions, some iterative methods which apply on some preconditioned systems are faster than iterative methods when one apply them to the original system (1). Sometimes, their assumptions are too strong in many cases. Hence, Li et al. [2] improved their method and presented a new preconditioner, which overcome the shortcomings in [1]. To solve the linear system (1), many preconditioners have been proposed [3, 4, 5, 6, 7, 8].

For any splitting,  $A = M - N$  with  $\det(M) \neq 0$ , the basic iterative method to solve system (1) is

$$x^{(k+1)} = M^{-1}Nx^{(k)} + M^{-1}b, \quad k = 0, 1, 2, \dots$$

where  $x^{(0)}$  is an initial vector. Matrix  $M^{-1}N$  is called an iteration matrix of the basic iterative method and the method is convergent if  $\rho(M^{-1}N) < 1$ .

In comparison of two convergent iterative methods, the faster method is that with smaller spectral radius of its iteration matrix. The effective method to decrease the spectral radius is to precondition the linear system (1), namely,

$$PAx = Pb, \quad (2)$$

where  $P$  is a nonsingular matrix. The corresponding basic preconditioned iterative method is given in general by

$$x^{(k+1)} = M_p^{-1}N_p x^{(k)} + M_p^{-1}b, \quad k = 0, 1, 2, \dots$$

where  $PA = M_p - N_p$ . Authors in [8] set  $P_\alpha = I + S_\alpha$  and authors in [9] set  $P_\beta = I + K_\beta$  where  $S_\alpha$  and  $K_\beta$  have the following forms

$$S_\alpha = \begin{pmatrix} 0 & -\alpha_1 a_{1,2} & 0 & \cdots & 0 \\ 0 & 0 & -\alpha_2 a_{2,3} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & 0 & -\alpha_{n-1} a_{n-1,n} \\ 0 & 0 & \cdots & 0 & 0 \end{pmatrix}, \quad K_\beta = \begin{pmatrix} 0 & 0 & \cdots & 0 & 0 \\ -\beta_1 a_{2,1} & 0 & 0 & \cdots & 0 \\ 0 & & \ddots & \cdots & 0 \\ \vdots & \vdots & & \ddots & 0 \\ 0 & 0 & \cdots & -\beta_{n-1} a_{n,n-1} & 0 \end{pmatrix}.$$

In this paper we introduce a new preconditioner by setting  $\tilde{P} = I + S_\alpha + K_\beta$  with above  $S_\alpha$  and  $K_\beta$ . Numerical results show that the spectral radius of iterative matrix in our new preconditioned system is lower than spectral radii of iterative matrices of preconditioned systems in [8] and [9]. First we change system (1) to  $\tilde{P}Ax = \tilde{P}b$  or

$$A_{\alpha\beta}x = b' \quad (3)$$

where  $A_{\alpha\beta} = (I + S_\alpha + K_\beta)A$ ,  $b' = (I + S_\alpha + K_\beta)b$ . By splitting  $A = I - L - U$  we have

$$A_{\alpha\beta} = I - L - U + S_\alpha + K_\beta - S_\alpha L - S_\alpha U - K_\beta L - K_\beta U.$$

Therefore, the iteration matrix of Gauss-Seidel(GS) method for system (3) is

$$T_{\alpha\beta} = M_{\alpha\beta}^{-1}N_{\alpha\beta} = (I - L + K_\beta - P_{\alpha\beta}L)^{-1}(U - S_\alpha + P_{\alpha\beta}L)$$

where  $P_{\alpha\beta} = (S_\alpha + K_\beta)$ .

We would like  $M_{\alpha\beta}$  be a nonsingular matrix, as  $M_{\alpha\beta}$  is a triangular matrix, hence it is enough that its diagonal elements be nonzero. The diagonal elements of  $M_{\alpha\beta}$  are  $1 - \alpha_i a_{i,i+1} \cdot a_{i+1,i}$ ,  $i = 1, 2, \dots, n-1$ , therefore,  $M_{\alpha\beta}$  is a nonsingular matrix if

$$\alpha_i a_{i,i+1} \cdot a_{i+1,i} \neq 1, \quad i = 1, 2, \dots, n-1. \quad (4)$$

From now on, by assuming (4), we show that  $\rho(M_{\alpha\beta}^{-1}N_{\alpha\beta}) < 1$ , that is, the Gauss-Seidel method for (3) converges.

## PRELIMINARIES AND NEW PRECONDITIONER

Without loss of generality, we split  $A$  in (1) as  $A = I - L - U$ , where  $I$  is the identity matrix,  $-L$  and  $-U$  are strictly lower and upper triangular matrices of  $A$ , respectively. Also we assume that  $a_{i,i+1} \neq 0$  and  $a_{i,i-1} \neq 0$ .

**Definition 1.** [10]. The splitting  $A = M - N$  is called an  $H$ -splitting if  $\langle M \rangle - |N|$  is an  $M$ -matrix, where  $|N| = (|n_{ij}|)$  and  $\langle M \rangle$  is the comparison matrix of  $M$ .

**Lemma 1.** [10]. Let  $A = M - N$  be a splitting. If it is an  $H$ -splitting, then  $A$  and  $M$  are  $H$ -matrices and  $\rho(M^{-1}N) \leq \rho(\langle M \rangle^{-1} |N|) < 1$ .

**Lemma 2.** [11]. Let a real matrix  $A$  have non-positive off-diagonal entries. Then matrix  $A$  is an  $M$ -matrix if and only if there exist some positive vectors  $u = (u_1, \dots, u_n)^T > 0$  such that  $Au > 0$ .

**Theorem 1.** [8]. Let  $A$  be an  $H$ -matrix with unit diagonal elements,  $A_\alpha = (I + S_\alpha)A = M_\alpha - N_\alpha$ ,  $M_\alpha = I - L - S_\alpha L$  and  $N_\alpha = U - S_\alpha + S_\alpha U$ . Let  $u = (u_1, \dots, u_n)^T$  be a positive vector such that  $\langle A \rangle u > 0$ . Assume that  $a_{i,i+1} \neq 0$  for  $i = 1, 2, \dots, n-1$ , and

$$\alpha'_i = \frac{u_i - \sum_{j=1}^{i-1} |a_{i,j}|u_j - \sum_{j=i+2}^n |a_{i,j}|u_j + |a_{i,i+1}|u_{i+1}}{|a_{i,i+1}| \sum_{j=1}^n |a_{i+1,j}|u_j}$$

then  $\alpha'_i > 1$  for  $i = 1, 2, \dots, n-1$  and for  $0 \leq \alpha_i < \alpha'_i$ , the splitting  $A_\alpha = M_\alpha - N_\alpha$  is an  $H$ -splitting and  $\rho(M_\alpha^{-1}N_\alpha) < 1$  so that the iterative method (2) converges to the solution of system (1).

**Theorem 2.** [9]. Let  $A$  be an  $H$ -matrix with unit diagonal elements,  $A_\beta = (I + K_\beta)A = M_\beta - N_\beta$ ,  $M_\beta = I - L + K_\beta - K_\beta L$  and  $N_\beta = U + K_\beta U$ . Let  $u = (u_1, \dots, u_n)^T$  be a positive vector such that  $\langle A \rangle u > 0$ . Assume that  $a_{i,i-1} \neq 0$  for  $i = 2, \dots, n$ , and

$$\beta'_i = \frac{u_i - \sum_{k=1}^{i-2} |a_{i,k}|u_k - \sum_{k=i+1}^n |a_{i,k}|u_k + |a_{i,i-1}|u_{i-1}}{|a_{i,i-1}| \sum_{k=1}^n |a_{i-1,k}|u_k}$$

then  $\beta'_i > 1$  for  $i = 2, \dots, n$  and for  $0 \leq \beta_i < \beta'_i$ , the splitting  $A_\beta = M_\beta - N_\beta$  is an  $H$ -splitting and  $\rho(M_\beta^{-1}N_\beta) < 1$  so that the iterative method (2) converges to the solution of system (1).

**Theorem 3.** By assumptions of Theorems 1 and 2, if  $A_{\alpha\beta} = (I + P_{\alpha\beta})A = M_{\alpha\beta} - N_{\alpha\beta}$  where  $M_{\alpha\beta} = (I - L + K_{\beta} - P_{\alpha\beta}L)$  and  $N_{\alpha\beta} = (U - S_{\alpha} + P_{\alpha\beta}U)$ , suppose that  $u = (u_1, u_2, \dots, u_n)^T$  is a positive vector such that  $\langle A \rangle u > 0$ , also  $a_{i,i+1} \neq 0$  for  $i = 1, 2, \dots, n-1$  and  $a_{j,j-1} \neq 0$  for  $j = 2, 3, \dots, n$ , also  $\alpha'_i, \beta'_i$  are defined in Theorems 1 and 2, respectively. Then  $\alpha'_i > 1, \beta'_j > 1$  and for any  $0 \leq \alpha_i < \alpha'_i, 0 \leq \beta_j < \beta'_j$  every splitting  $A_{\alpha\beta} = M_{\alpha\beta} - N_{\alpha\beta}$  is an  $H$ -splitting and  $\rho(M_{\alpha\beta}^{-1}N_{\alpha\beta}) < 1$ .

*Proof.* By Theorems 1 and 2, we have  $\alpha'_i > 1$  and  $\beta'_j > 1$ . Thus it is enough to show that  $A_{\alpha\beta} = M_{\alpha\beta} - N_{\alpha\beta}$  is an  $H$ -splitting and  $\rho(M_{\alpha\beta}^{-1}N_{\alpha\beta}) < 1$ .

By Lemma 1 it is enough to show that splitting  $A = M_{\alpha\beta} - N_{\alpha\beta}$  is an  $H$ -splitting. But by Definition 1 we must show that  $\langle M_{\alpha\beta} \rangle - |N_{\alpha\beta}|$  is an  $M$ -matrix. Also, by Lemma 2 if there exists a positive vector  $u$  such that  $\langle A \rangle u > 0$  then  $A$  is an  $M$ -matrix. Thus it is enough to show that there exists  $u > 0$  such that  $(\langle M_{\alpha\beta} \rangle - |N_{\alpha\beta}|)u > 0$ .

We know that

$$\begin{aligned} M_{\alpha} &= I - L - S_{\alpha}L, & N_{\alpha} &= U - S_{\alpha} + S_{\alpha}U, \\ M_{\beta} &= I - L + K_{\beta} - K_{\beta}L, & N_{\beta} &= U + K_{\beta}U, \\ M_{\alpha\beta} &= (I - L + K_{\beta} - S_{\alpha}L - K_{\beta}L), & N_{\alpha\beta} &= (U - S_{\alpha} + S_{\alpha}U + K_{\beta}U), \end{aligned}$$

therefore

$$\langle M_{\alpha\beta} \rangle - |N_{\alpha\beta}| = \langle M_{\alpha} + K_{\beta}(I - L) \rangle - |N_{\alpha} + K_{\beta}U|$$

now, we prove the following

$$[(\langle M_{\alpha\beta} \rangle - |N_{\alpha\beta}|)u] \geq [(\langle M_{\alpha} \rangle - |N_{\alpha}|)u] + [(\langle M_{\beta} \rangle - |N_{\beta}|)u], \tag{5}$$

or we must prove that

$$\begin{aligned} &(\langle M_{\alpha} + M_{\beta} - (I - L) \rangle)u - |N_{\alpha} + N_{\beta} - U|u \\ &\geq (\langle M_{\alpha} \rangle + \langle M_{\beta} \rangle)u - (|N_{\alpha}| + |N_{\beta}|)u \end{aligned} \tag{6}$$

relation (6) holds if we have the followings

$$|N_{\alpha} + N_{\beta} - U|u \leq (|N_{\alpha}| + |N_{\beta}|)u \tag{7}$$

$$(\langle M_{\alpha} + M_{\beta} - (I - L) \rangle)u \geq (\langle M_{\alpha} \rangle + \langle M_{\beta} \rangle)u. \tag{8}$$

To prove (7) we have

$$\begin{aligned} &|N_{\alpha} + N_{\beta} - U|u_i \\ &= |\beta_{i-1}a_{i,i-1}a_{i-1,i}|u_i + \sum_{j=i+1}^n |\beta_{i-1}a_{i,i-1}a_{i-1,j} - (a_{i,j} - \alpha_i a_{i,i+1}a_{i+1,j})|u_j \end{aligned}$$

and

$$\begin{aligned} &[(|N_{\alpha}| + |N_{\beta}|)u]_i \\ &= |\beta_{i-1}a_{i,i-1}a_{i-1,i}|u_i + \sum_{j=i+1}^n (|\beta_{i-1}a_{i,i-1}a_{i-1,j} - a_{i,j}| + |a_{i,j} - \alpha_i a_{i,i+1}a_{i+1,j}|)u_j \end{aligned}$$

hence, it is enough we prove the following

$$\begin{aligned} &\sum_{j=i+1}^n (|\beta_{i-1}a_{i,i-1}a_{i-1,j} - a_{i,j}| + |a_{i,j} - \alpha_i a_{i,i+1}a_{i+1,j}|)u_j \\ &\geq \sum_{j=i+1}^n |\beta_{i-1}a_{i,i-1}a_{i-1,j} - (a_{i,j} - \alpha_i a_{i,i+1}a_{i+1,j})|u_j \end{aligned}$$

the above relation holds if we have the following

$$|\beta_{i-1}a_{i,i-1}a_{i-1,j}| \leq |\beta_{i-1}a_{i,i-1}a_{i-1,j} - a_{i,j}|$$

which it holds, because  $A$  is an  $H$ -matrix.

To prove (8) we have

$$\begin{aligned} & [(\langle M_\alpha + M_\beta - (I-L) \rangle)u]_i \\ &= |1 - \alpha_i a_{i,i+1} a_{i+1,i}| u_i - \sum_{j=1}^{i-1} |\alpha_i a_{i,i+1} a_{i+1,j} + \beta_{i-1} a_{i,i-1} a_{i-1,j} - a_{i,j}| u_j \end{aligned}$$

and

$$\begin{aligned} & [(\langle M_\alpha \rangle + \langle M_\beta \rangle)u]_i \\ &= (|1 - \alpha_i a_{i,i+1} a_{i+1,i}| + 1) u_i - \sum_{j=1}^{i-1} (|a_{i,j} - \alpha_i a_{i,i+1} a_{i+1,j}| + |a_{i,j} - \beta_{i-1} a_{i,i-1} a_{i-1,j}|) u_j \end{aligned}$$

also, it is enough we prove the following

$$\begin{aligned} & - \sum_{j=1}^{i-1} |\alpha_i a_{i,i+1} a_{i+1,j} + \beta_{i-1} a_{i,i-1} a_{i-1,j} - a_{i,j}| u_j \\ & \geq u_i - \sum_{j=1}^{i-1} (|a_{i,j} - \alpha_i a_{i,i+1} a_{i+1,j}| + |a_{i,j} - \beta_{i-1} a_{i,i-1} a_{i-1,j}|) u_j \end{aligned}$$

as there exists  $j$  such that  $a_{ij} \neq 0$ , therefore

$$\begin{aligned} & |\alpha_i a_{i,i+1} a_{i+1,j} - a_{i,j} + \beta_{i-1} a_{i,i-1} a_{i-1,j} - a_{i,j} + a_{i,j}| \\ & < |\alpha_i a_{i,i+1} a_{i+1,j} - a_{i,j} + \beta_{i-1} a_{i,i-1} a_{i-1,j} - a_{i,j}| \\ & \leq |a_{i,j} - \alpha_i a_{i,i+1} a_{i+1,j}| + |a_{i,j} - \beta_{i-1} a_{i,i-1} a_{i-1,j}| \end{aligned}$$

then

$$\begin{aligned} & |\alpha_i a_{i,i+1} a_{i+1,j} - a_{i,j} + \beta_{i-1} a_{i,i-1} a_{i-1,j} - a_{i,j} + a_{i,j}| \\ & < |a_{i,j} - \alpha_i a_{i,i+1} a_{i+1,j}| + |a_{i,j} - \beta_{i-1} a_{i,i-1} a_{i-1,j}|, \quad j = 1, \dots, i-1 \end{aligned}$$

adding the above relations completes the proof, because we can select  $u_i$  small enough. Note that if  $\langle A \rangle u > 0$  then for all positive  $n$ , we have  $\langle A \rangle \frac{u}{n} > 0$ .  $\square$   $\square$

## NUMERICAL EXAMPLE

**Example 1.** Consider the following Laplace equation

$$u_{xx} + u_{yy} = 0, \text{ on } R = [0, 0.5]^2$$

with boundary conditions

$$u(0, y) = 0, \quad u(x, 0) = 0, \quad u(x, 0.5) = 200x, \quad u(0.5, y) = 200y.$$

Applying the finite difference method with the uniform mesh size and  $n$  points, we obtain a linear system  $Ax = b$ . We solved the system by four different methods and different values of  $n$ . In all cases the spectral radii of the new method was the least one.
