

1 **S5. Tissue and parcellated volumes for each cohort**

2 We here show results from a repeat of the analysis performed for Table 2, using brains from cohort 1
 3 (Table 3), mean (standard deviation) age 128.4 (7.4) days and cohort 2 (Table 4), age 471.5 (5.9) days
 4 separately. The pattern of mean volumes, Tc1 > WT (or vice versa) was the same, in each structure, in
 5 both cohorts, and the same as when both were combined (Table 2). The tendency when analysing the
 6 two cohorts separately was to decrease significance: p-values were generally greater and more likely
 7 to exceed the arbitrary significance threshold of $p=0.05$.
